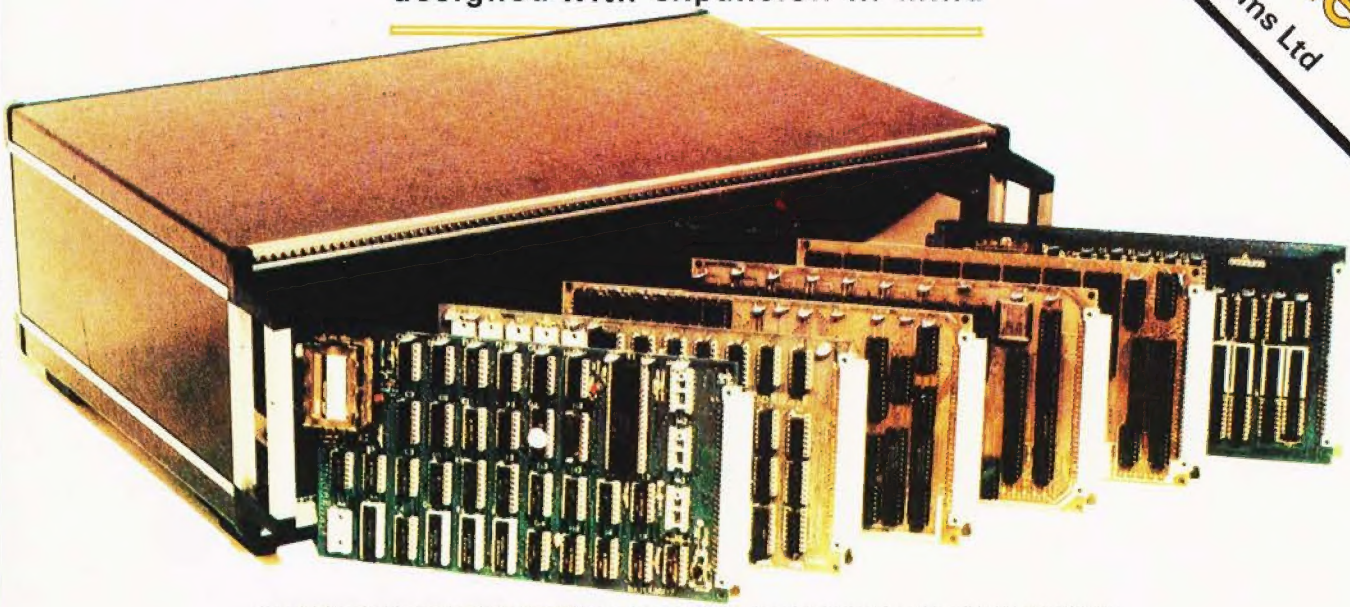
READY

microtan

designed with expansion in mind

Tangerine Computer Systems Ltd



TANGERINE COMPUTERS get you into computing for less than £80 with

microtan 65

a one-board 6502-based microcomputer

But it doesn't stop there - Microtan is a SYSTEM

Start your expansion with **TANEX** - cassette interface, 16 I/O lines, two 16 bit counter timers, data bus buffering, memory mapping and a further 1K of RAM. Just plug in extra chips for 8K of RAM, 16 more I/O lines, two more counter timers and a serial I/O line with RS232/20 mA loop and full modem control.

XBUG - a firmware package with cassette file handling rountines, a line-by-line assembler/dis-assembler, 10K extended Microsoft BASIC (as used by Apple, Tandy and NASCOM).

TANRAM - up to 40K of extra memory.

The system rack houses up to 12 boards. Extra serial and parallel I/O boards offer up to 128 I/O lines (16 eight bit ports) and eight serial I/O ports.

The full system will include high definition colour graphics, A to D and D to A boards, IEEE 488 interface, PROM programmer, disc controller and TANDOS, a 6502 CPM system.

Printing on printers p 71

Computing Today is constantly on the look-out for well written articles and programs. If you think that your efforts meet our standards please feel free to submit your work to us for consideration.

All material should be typed, but neat hand-written copy may be considered. Any programs submitted must be listed, cassette tapes and discs will not be accepted, and should be accompanied by sufficient documentation to enable their implementation. Please enclose an SAE if you want your manuscript returned, all submissions will be acknowledged. Any published work will be paid for.

All work for consideration should be sent to the Acting Editor at our Charing Cross Road address.

ABC Member of the Audit Bureau of Circulation

Computing Today is normally published on the second Friday in the month preceding cover date.
Distributed by: Argus Press Sales & Distribution Ltd, 12-18 Paul Street, London EC2A 4JS. 01-247 8233.
Printed by: Alabaster Passmore & Sons Ltd, Maidstone, Kent.

Subscription Rates : UK £10 including postage. Airmail and other rates upon application to CT Subscriptions, Computing Today, 145 Charing Cross Road, London WC2H 0EE.

DECODING MODULE: For UK101 to provide I/O post for interfacing with external devices. As described in 'PE' Jan/Feb 81. Also Superboard II Compatible.
Kit Price **£27.50**.

RAM + EPROM BOARD: PCB TO HOLD UPTO 8K RAM (16x2114) + 4-8-16K OF EPROM. Can be easily used with most systems. Fully decoded and bufferred lay-out on board.
Bare PCB **£16.50** + VAT, PCB + 16K RAM + 4K EPROM **£62** + VAT

EPROM ERASER TYPE UV140: Will erase upto 14 EPROMs in approximately 20 minutes.
£61.50 + VAT

DOMESTIC TV TO VDU CONVERTER KITS (16 lines x 64 characters)
ELEKTERMAINAL: Serial I/O VDU interface kit. Can be used as stand alone VDU Terminal (with ASCII Keyboard) or as TV interface for any microcomputer system.
£56 + VAT

PEVDU: Memory Mapped VDU kit which interfaces easily with most microcomputer systems.

THE WORLD'S FINEST HOBBY COMPUTING SOFTWARE

Phone Now for Special Offers on TOOLKIT. T.E.S. and RAM

MASTER PACK MASTER PACK

for the
TRS 80 Level II
COMPUKIT UK 101
SHARP MZ-80K
OHIO SUPERBOARD
VIDEO GENIE
MICROTAN

TOOLKIT

dramatically extends the UK101 & S/board with many new commands:

* FIND - any set of up to 20 chars. in a BASIC listing.
* DELETE - any block of lines.
* AUTO - new line numbers appear automatically.
* RENUMBER - full feature version!
* TRACE - displays all executed line nos.
* CONTROLLED LIST - lists program in set blocks.
* ERROR MESSAGES - unmasked & displayed correctly.

TOOLKIT is supplied in a 2716 EPROM for insertion into an EPROM board.It is fully compatible with all monitors. Developed by NONSUCH SOFTWARE for sole distribution by PREMIER PUBLICATIONS. Complete with User Manual.

PRICE £39.95 inc VAT. (plus 80p p&p)

T.E.S.

A complete Hardware System for the UK101/Superboard. Highly versatile;professional design;low cost kits.

* EPROM CARD	- takes 4 x 2716 EPROMS.	£45.50 inc.
* MOTHER BOARD	- full PSU,less transf.	£45.50 inc.
* MOTHER BOARD	- without PSU.	£32.75 inc.
* 8K RAM CARD	- takes 16 x 2114.	£43.20 inc.
* 8K RAM CARD	- fully populated.	£77.95 inc.

IMMEDIATE DELIVERY ON ALL BOARDS

New Software for 1981

* DRAUGHTS - plays a stunning,interactive game,the best we've seen.Superb graphics and numerous user-features. Available NOW for TRS80/VG (UK101. FEB) £14.95
* CRIBBAGE - addictive implementation of this popular card game.Plays a mean hand! (UK101 only) £10.95
* ALIEN STRONGHOLD - new concept in SPACE GAMES. Create your OWN Stronghold then commence battle. Save your design onto tape for future use! (UK101/SB) £7.95
* DEADLY TRIANGLE - destroy the fleet by firing laser at the Triangle.Beware!They fire back! (UK101/SB) £7.95
* UTILITIES - our most popular package is now available for all the systems we support. See previous ads for details. Still only £14.95
* CATACOMBS - fantastic 3-D maze game. Lose yourself in this three-dimensional puzzle for hours on end! Available NOW for UK101/TRS80/VG/SHARP soon

All prices include VAT. Please add 50p p&p.

TO ORDER: Enjoy the ultimate demonstration of program quality - in your own home on your own computer, with the security of our 10-day money-back guarantee of satisfaction

UK: Just send cheque/PO to include 50p to cover post, packing and insurance, quoting CT/ 2 on your order please.

OVERSEAS: Please deduct VAT (divide price by 1.15) and add postage for 200 grams weight OR send two International Reply Coupons for quotation/program details.

Orders normally despatched within five working days

NEW YORK NUMBERS
From Cyndy Miles, our New York correspondent

New York has taken to gambling for raising money to pay for public services. The State government has done it in a big way by setting up a complex computerised system, with hundreds of terminals in the New York City area alone, where the punters can place their bets. It's not a game of skill. Luck — lots of it — is all that's needed, superstition is the ruling force.

All the numbers game player does is go to the nearest store or coffee bar where there is a computer terminal, pick three numbers, choose one of nine ways to bet, hand over anything from 50 cents to $5 for each wager, and then wait for the televised draw that night. He or she has a 500-1 chance of winning.

The terminals are simple keyboards operated by shopkeepers, who tap in the wager and hand the punter a computerised ticket recording the details.

The information is then fed to a central computer in Albany, the state capital, where details from more than 700 selling points are collated each day.

Of course, there have been teething problems. Not least that of maintaining good will among participating shopkeepers.

"At first it was a novelty," explained a newsagent in downtown Manhattan. "Now it's affecting our business. Every day there are long lines of people waiting to bet. The shop gets crowded. Pilfering has increased.

"I'm fed up with the whole thing, but if I get the machine taken away my rival will install it. That would be even worse for business.

"It's the same in other places. It's just not working for us."

Neither, it seems, does the equipment work for them. Breakdowns at the terminals are not uncommon. The punters get angry and the shopkeepers become increasingly upset and frustrated.

But despite the hassles, business has not been bad in the month or so since the legalised numbers game was launched and the New York State Lottery, which runs the business, seems to be well on the way to its projected 100 million dollars by March 31.

Of that cash more than half will go back to the players in winnings, 35% will go to State funds, and the rest will be eaten up by administration costs.

On the face of it New York's venture into the world of gambling has been successful.

But it has severe competition. While the State offers legality, the backstreet boys running a muti-million dollar illegal game offer better odds and tax-free winnings.

Running them off the streets, as the State Lottery hopes to do, is not going to be easy, especially if computerisation proves to be more of a hinderance than a help.

And, so far, luck hasn't been really with the State.

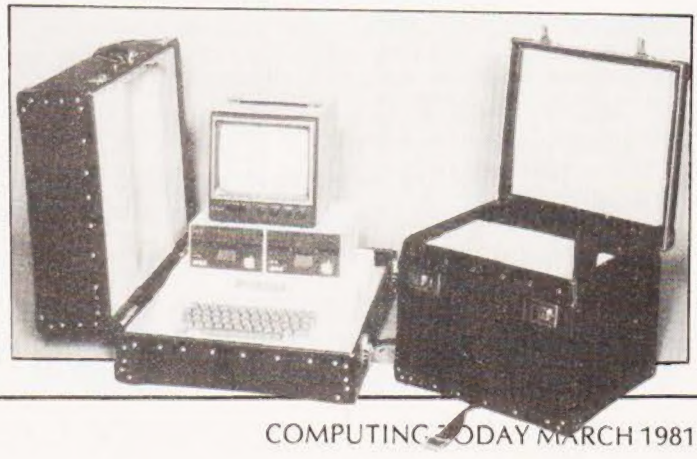
(Reprinted with the kind permission of Datalink.)

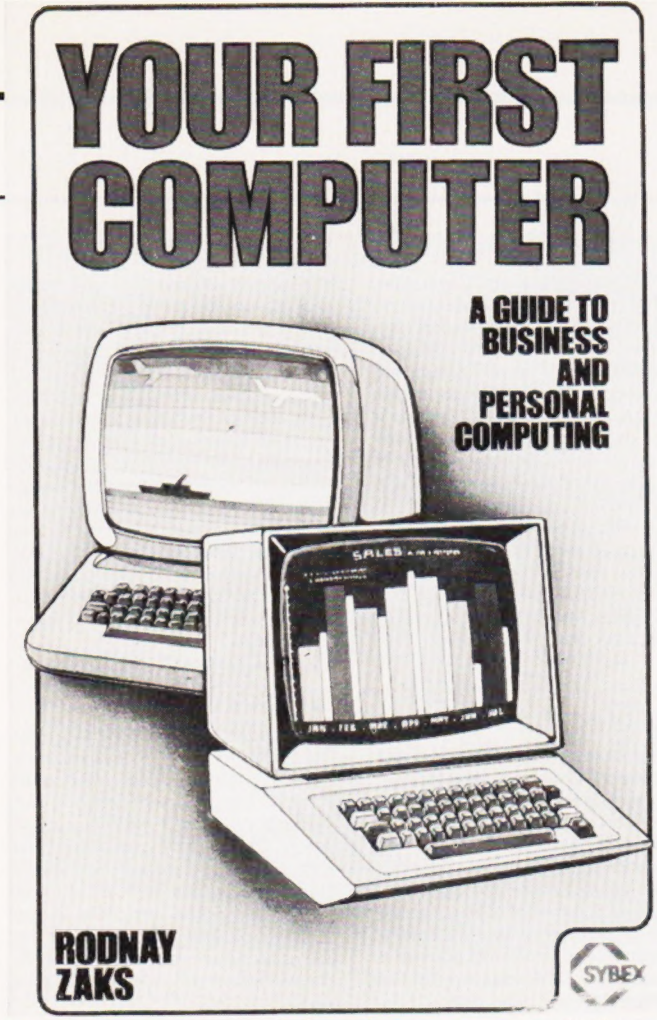
THE LANGUAGE OF TOMORROW?

If you've never been to school in Denmark the chances are the name COMAL doesn't mean a lot to you. The chances are equally high, however, that you will soon hear an awful lot about it. COMAL stands for COMmon Algorithmic Language and is, effectively, a structured form of BASIC. Anyone who can program in BASIC can, with a little thought, program in COMAL, it uses the same common 'core' of commands but borrows considerably from the 'structure' of languages like ALGOL 68 and Pascal to give commands like IF . . . THEN . . . ELSE and procedures rather than subroutines. COMAL will shortly be available from your local Commodore educational or user group and will be public domain software in that there will be no charge made for copying the software. It runs on 3032 and 8032 machines but is disc based (it takes 26K) although the possibility exists for Commodore to offer a subset on cassette or even in ROM. The language is the minimum educational requirement in Denmark and appears to be taking off in other European countries, it ws first thought of in 1974. Designed by Borge Christensen it certainly appears to offer all the benefits of structured languages without the rigid constraints that, for example, Pascal needs. With the growing demand for programmers who are prepared for the real world rather than the classroom it may well be that COMAL is the language to choose. We'll be taking a very close look at what it has to offer in the near future so keep your eyes tuned-in to our editorial. Information can be sought from the Commodore Educational people in Euston Road but it is unlikely that your local dealer will be able to help the individual user for a few months yet.

PACKED APPLES

If you tote your micro around a lot it probably needs a nice padded case for its protection. Apple owners can now buy two custom-made transit boxes, one takes an Apple and two floppy drives, the other takes a monitor. The Apple can be used whilst still in the bottom half of its box so the set-up should prove ideal for travelling demonstrations etc. The boxes will cost you £39.50 and £19.50 respectively, to which you have to add VAT and carriage. For details of these and all the other Apple products contact Microsense Computers at Finway Road, Hemel Hempstead, Herts HP2 7PS.





NEWS

With a rapidly growing interest in the microcomputer both with the small business and home environments, together with the reduction in price of both hardware and software many people are becoming more interested in learning the 'how', 'what' and 'why' of computers. The title of this book together with a short glimpse at the preface which informs the reader that "neither a technical background nor a prior knowledge of computers is required", should set our budding computer operator rushing to the pay desk with his £5.95 to purchase it. The quotes from various American computer magazines, found just inside the front cover, seem to be ecstatic: "refreshingly clear", "clear, comprehensive, practical", "good clear prose" are but a few. Computing Today does not entirely agree. Rodney Zaks, without question a respected writer in the computing field, falls into the same traps that others have before him when faced with the difficult task of trying to explain the rudiments of the micro/mini computer to someone with no prior knowledge of the subject. Many people, whether they already have some knowledge or not, need books, magazine articles or a patient tutor to supply answers to a number of questions which themselves generate more questions. The difficulty in writing a book or magazine article is in determining for whom you are writing and how much information you should include. Rodney Zaks has defined for whom the book is written — those with "neither a technical background nor prior knowledge". Its purpose we are told "is to explain what a microcomputer is, how it works and what it can do".

The impression I get is that he could not resist using computer terms that, although in common usage in professional circles, are not really of immediate importance to someone investigating the advantages of buying a small micro system. Having been fairly critical of the aims and achievements of 'Your First Computer', let us look more closely at what is contained between the covers. There are 14 chapters, starting in chapter 1 — 'The Microcomputer Era', with a witty scenario from a possible future, describing how the computer could so easily assist and compliment humanity throughout everyday life.

Chapter 2 — 'Using the System' presents a cogent appraisal of today's microcomputer.

Chapter 3 — The contents page tells us 'Microcomputer Applications', the actual chapter heading gives us 'Basic Definitions'. Both titles could be valid and it is at this point I begin to feel uncertain at whom the book is aimed. Yes, the basic definitions are fairly clear but I can see that the reader with some previous knowledge would gain at the expense of the initiate who could wonder whether all these new terms were essential to his initial understanding of what a computer can do for him.

Chapter 4 — 'How the System Works' gives me the same impression — clear and concise but does the newcomer want so much detail at this stage? Can he take in this information in such a concentrated form?

Chapter 5 — 'Programming the Computer', again a fairly concentrated dose that could very well have a reader with no background knowledge reeling in his seat. It does contain an interesting example of an algorithm: "simply a step by step specification of the solution to the problem". The example is a simplified traffic control algorithm for a typical intersection (traffic light sequence at a crossroads, to us English). If used, the example given would end up with red, green and amber showing in one direction and green in the other ... Well, Mr. Zaks does say elsewhere that every system will occasionally suffer from software bugs ...

Chapter 6 — 'From BASIC to COBOL' takes a fairly intensive look at BASIC followed by a briefer look at APL and Pascal. FORTRAN and COBOL are mentioned but not at any great length. The emphasis, quite rightly in a book such as this, is on BASIC.

Chapter 7 — 'Business Computing' clearly states the case for the Business Computer and some applications. It follows with a fairly in-depth appraisal of a specific Mailing List Program and a Word Processing Program, both of which would, I feel, be more applicable to your second computer book than your first!

Chapter 8 — 'Selecting a System' and Chapter 9 — 'The Peripherals' can be read, understood and prove useful to anyone. They list all those points one should be aware of when contemplating the purchase and use of a computer.

Chapter 10 — 'Selecting a Microcomputer, starts with a 'micro-history of computers' that is concise and informative. This is followed by a brief résume of the salient points of a number of microcomputers, albeit American and, as any list in this field must be, out of date on the day of publication. Nevertheless, it represents a comparative listing that will be useful for some time to come.

Chapter 11 — 'Economics of a Business System' offers a simplified formula to businessmen to assess the real cost of installation, maintenance and programming such a system.

Chapter 12 — 'How to Fail with a Business System' is a cautionary chapter on the sources of error that can occur without sufficient foresight.

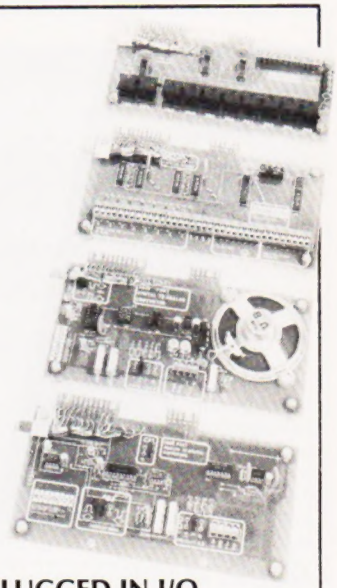
Chapter 13 — 'Help' would be a useful source for the American, but other than suggestions for general sources of information, is less help in this country.

Chapter 14 — 'Tomorrow' is very brief, a total of 1½ pages and although summarising possible developments in the field, could very well have been included elsewhere.

Six appendices conclude the book, covering in a fairly concentrated form such topics as Computer Logic, Bits and Bytes, Files and Records and lists of American manufacturers.

In conclusion therefore, a book that does not fulfill its stated intention but still provides useful reading for someone who already has some knowledge of the subject.

Your first computer . . . A Guide for Business and Personal Computing by Rodney Zaks, published by Sybex at £5.95 ISSN 0-89588-045-8.



PLUGGED IN I/O

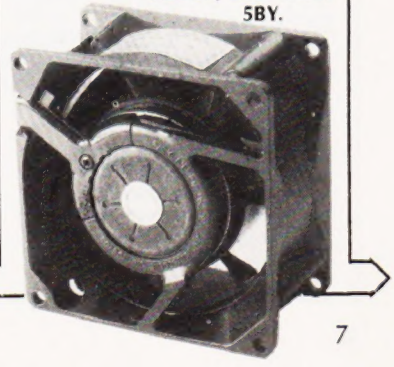
Machsize Ltd of York House, Clarendon Avenue, Leamington Spa, Warks., have added two more boards to their general purpose I/O range. Both are for the PET and offer analogue to digital and digital to analogue conversion. Each board is supplied complete with documentation and necessary software to drive it and will cost £69.95. The two devices are matched in terms of their input and output characteristics.

SPACED OUT

Owing to heavy demand we are no longer able to supply the complete Space Invasion program listing. Any orders that we have received will be dealt with, but we cannot guarantee to supply any further copies.

QUIET 'N COOL

Constructors of computer equipment for use in the home seldom seem to fit fans. Maybe they have implicit faith in their equipment, but it's often better not to trust to luck. Many of the existing fans for small computers are both bulky and noisy, but now there's an alternative, the Sprite. It's only 3.1" square and 1.6" thick so it should fit into the smallest computer box without too much trouble. The new models are denoted by the range suffix G and H, they will directly replace their older, noisier brothers. For prices and quantity discounts contact VSI Electronics (UK) Ltd Roydonbury Industrial Park, Horsecroft Road, Harlow, Essex CM19 5BY.



MEDIA MAGIC

INMAC, a fairly new addition to the legions of UK media suppliers, have sent word of two of their latest offerings. First out of the bag was a new cleaning kit for floppy discs consisting of three cleaning discs and two bottles of the necessary solution. All you have to do is soak the exposed portion of the cleaning disc with the solution, slap it in the drive for 30 seconds and, bingo, one set of clean heads. This should, they say, be done once a week. For 8½" drives a kit will cost you £30.00 and for 5¼" it's £28.00, each kit is sufficient for 60 or more cleanings. The second offering is extension cables for your VDUs. The idea being to get unnecessary people out of the computer room and back to their offices where, no doubt, they can play 'Invaders' or 'Adventure' in peace! For details of these and all the other INMAC offerings contact them direct at 18 Goddard Road, Astmoor Industrial Estate, Runcorn, Cheshire WA7 1QF.

RETAILERS BRANCH OUT

The Computer Retailers Association, or CRA for short, is expanding rapidly. They have just announced the formation of a committee to advise on the formation of Apple, Sharp and Commodore dealer groups within the CRA and have added Shannons Radio of Manchester and HB Computers of Luton to the fold. This brings the number of members up to 25 in the first year of operation. For full details of how the CRA can help you if you have a complaint against any of its members or how you can benefit fron the code of practice that it operates contact the Secretary, Owles Hall, Buntingford, Herts. SG9 9PL.

ARE BUREAUX BEST?

A seminar is to be held at the London Chamber of Commerce and Industry on March 24th at 2.00pm. The topic under discussion is the relative merits of bureaux computers against your own small or micro computer. For non-members the afternoon will cost £34.50, members can attend for £26.45. The address to write to is 66 Cannon Street, London EC4N 5AB or give Miss C A Measures a ring on 01-248 4444.

IN NAME ONLY

In our news last month we published an item on the move to Slough by Ohio Scientific. What we didn't tell you, because we didn't know, was that the name Ohio Scientific (UK) Ltd is, in fact, owned by American Data and not by the US company of the same name. American Data are the main agents for Ohio computers and it is they who have established the sales and service base at Langley in Slough. To add mayhem to the already existing confusion they supplied the wrong telephone number, it should be Slough (0753) 75915. Our apologies to anyone who may have been misled.

WORKSHOP

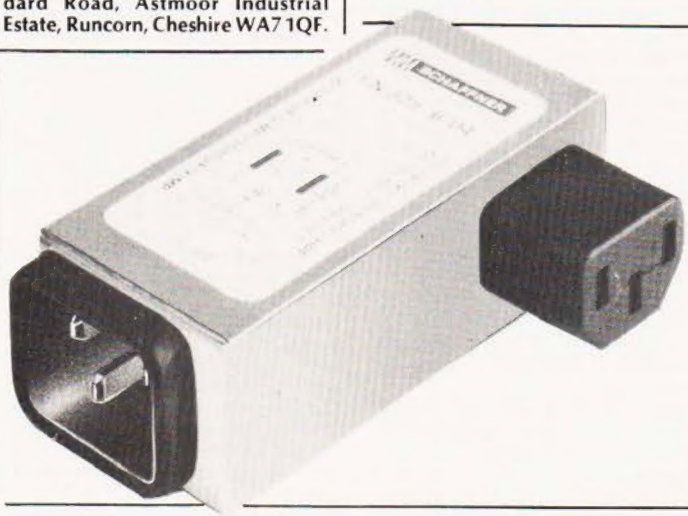
Roots and Williams of 63 Connaught Gardens, London N10 are running a regular monthly workshop for small businessmen who want to find out more about small business computers. They actually use their own system to demonstrate the various points, they've got an Alpha Micro. For details of the next date in the calendar contact John Roots at the above address or ring on 01-883 3656. The workshop will cost you £50 plus VAT.

TECHNICAL ENQUIRIES

Owing to increased pressures of work on our technical staff we are no longer able to offer a telephone technical enquiry service on Wednesday afternoons. If you do have a query about any published material in the magazine then it should be sent to our normal office address together with an SAE for our reply. In order to speed the service please ensure that you have remembered the SAE and that you have marked your envelope 'Technical Enquiry'.

PASCAL IN 16K

If you're a Pascal fancier and you own a NASCOM or an RML380Z then you might be interested in a new Interpreter and pseudo compiler from Enertech. The language requires a minimum of 16K of RAM and a memory mapped display and the package is supplied complete with a system bootstrap, floating-point package and a screen editor. Among the features offered by the implementation are the capability to handle real, integer and character variables, 32 bit floating point arithmetic with trig, exponential and log functions and compilation into re-locatable MAP code. The language is currently available on cassette tape for NASCOM 2s and RML380Zs at £35 and users will have the option to convert into EPROM at a later date if they wish. For full details contact Enertech direct at 32 Gildedge Road, Eastbourne, East Sussex.

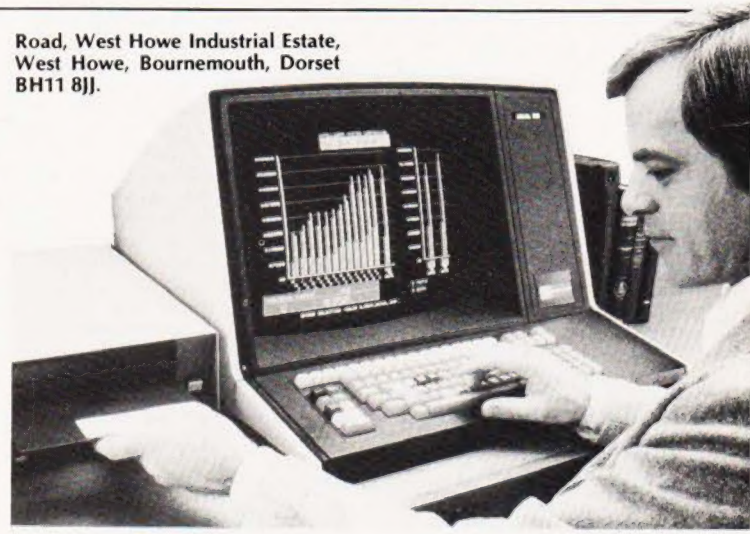


FILTER IT OUT

If you are using a microcomputer in a domestic or other electrically hostile environment you can now have plug-in protection. Just announced by Lyons Instruments are IEC in-line filters that cost a mere £8 each and they come in current ratings; 1A, 3A and 6A. Designed to plug into existing IEC power inlets on the back of your computer and have the mains lead connected into the filter it probably represents the quickest and cheapest way to protect a single piece of equipment against RFI. For a full technical specification contact Lyons at Hoddesdon, Herts.

INTO COLOUR WITH CP/M

Fancy a desktop colour computer for your business? Techex, the UK suppliers of Intecolor, are now offering them with CP/M compatability. This gives access to all the software written in that format, such as ready-to-use sales and general ledgers, mailing lists and wordprocessors — all in glowing colour! The Intecolor range is available with 13 or 19" VDUs, 32K of RAM (expandable to 48K), 8K of ROM and up to 1182K of disc storage. Also supplied is a 'Soft Disc' which contains ISCs version of the Microsoft Business BASIC with added colour commands. Microsoft COBOL and FORTRAN IV are optional. For details of the range contact Techex at 5b Roundways, Elliott Road, West Howe Industrial Estate, West Howe, Bournemouth, Dorset BH11 8JJ.



BUSINESS NEWS

SPEAKING OUT

Communications are the up-and-coming section of the computer market and no part of that market gets more press coverage than speech recognition. In an attempt to transfer the accumulated expertise of some fifteen years research to British Industry the National Physical Laboratory has, under the guidance of the DOI, set up a 'Speech Recognition Club'. The idea is that companies within the UK who think that they might be able to benefit from the work done at NPL subscribe to the club and, in return, get the latest technical information. The idea works the other way too in that the NPL will benefit from industry giving it specific research targets to meet rather than working in a pure research environment. We covered the work done at the NPL in our September 1979 issue if you are interested in reading up about it. Several British companies have taken up the offer and they include Ferranti Computer Systems, Plessey, Systems Designers, Quest Automation Research and Nexos Office Systems. Applications from other interested companies will be considered, the fee payable depends on the amount of technology you want to access.

BUSINESS PRINT

Commodore have finally announced an up-market printer for the new 8000 (SuperPET) range of computers. Aimed directly at the small business market, the new device — the 8024, offers 160 cps printing on a 9 by 7 format. A wide variety of paper widths can be handled so the machine can be used for labelling as well as invoices and the like. The price tag is £1160 plus the ubiquitous VAT. Owners of the 3000 series can use the printer too, it's driven from the IEEE-488 bus, but at this price it is not really a viable alternative to some of the other devices coming onto the market. For product information contact their Information Centre at 360 Euston Road, London NW1.

TIMESHARE AND SAVE

If you want to access a computer to get the benefits of a bureau service in your own home, then the latest announcement by Computer Time Sharing Services is worth close scrutiny. They are announcing even cheaper rates for block usage which can provide up to 50% discount. In addition to these offerings for the business user they are continuing to provide their 99p per hour, off-peak service for the home user. For a detailed list of the services they can offer and the relative charges contact CTSS at Caldare House, 144/146 High Street, Chadwell Heath, Essex RM6 6NT.

MICRO MD

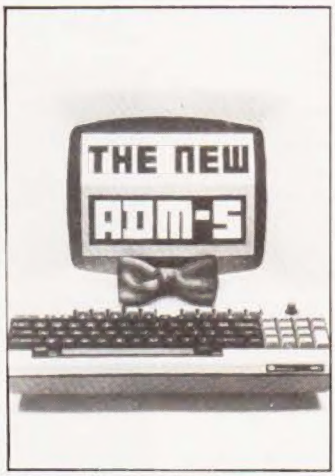
The Micro Computer Centre of 28 Sheen Lane, London SW14 has set up a 'Micro Clinic' for PET and Apple users within a 50 mile radius of London. For a basic annual fee of approximately 10-15% of the capital cost you will receive regular maintenance calls and be guaranteed that your machine will never be 'down' for more than 24 hours. If they can't fix it on the spot then they'll lend you a machine whilst the corpse is being resuscitated back at base. If you are interested in getting further information contact Malcolm North at the above address.

IMPORTANT NOTICE

Readers have recently confused Electronics Today Limited as being associated with the ownership of our magazine, Electronics Today International. Our magazine is owned by Modmags Limited, part of the Argus Press Holdings Limited Group of Companies. Electronics Today Limited advertises in our magazine, as "Metac", but so as to prevent any further confusion we wish to make it clear that Electronics Today Limited is not in any way owned or managed by any member of the Argus Press Holdings Limited Group of Companies.

NEW DUMB ONE

Lear Siegler, the American VDU people, have recently announced a new dumb terminal in their ADM range. Designated the ADM-5 it is a low-cost, limited facility unit. It comes with a 12" screen capable of displaying a total of 1920 characters, true lower case font, numeric pad and cursor controls and a programmable display memory. Data transmission is by a 10 baud rate RS232 interface and there is an extension port for hard copy. A fully detailed information sheet will be available from Lear Siegler at Brookwood, Surrey or from their normal UK distributors soon.



CUT PRICE COMPUTING

Now that LSI Computers have introduced their M-Two small business computer the price of the M-One model is to be reduced. The basic model will now cost you £4200, a reduction of some £1700. The model comprises an 8K micro with a 60 cps matrix printer and a VDU. Storage is provided by two double density floppy drives giving over 1Mb of available space. To add to the fun you also get a choice of basic applications software, accounting, payroll etc. The new pricing is intended to put the system within the reach of a first-time business user who might otherwise be tempted by a 'hobby' machine which may be incapable of the work. Anyone interested in taking advantage of the low prices should contact LSI Computers at Copse Road, St Johns, Woking, Surrey GU21 1SX.

MOBILE MICROS

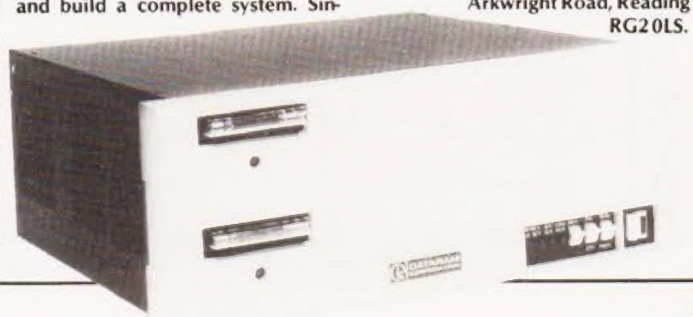
That annual moving computer show is back again. Computermarket '81 will be making stops in Glasgow, at the Albany Hotel, from the 17th to the 19th of March and then moving down to the New Century Hall, Manchester from the 24th to the 26th of March. The remaining two stops on its lightning tour are the Albany Hotel, Birmingham from the 31st of March to the 2nd of April and the West Centre Hotel in London from the 7th to 9th of April. At all the venues the exhibition will be open from 10am to 5pm and, unless you are pre-registered, it will cost you £2.50 to get in. Pre-registered tickets are available from Couchmead Ltd at 42 Great Windmill Street, London W1V 7PA on receipt of an SAE.

HEALTHY HEATH

It's not often that a company reduces the price of its goods but the latest Heathkit catalogue reveals that the cost of both the H14 matrix printer and the H19 VDU have dropped. You can get your own copy of this kit-builders' fantasia by sending 25p in stamps to Heath Electronics (UK) Ltd, Bristol Road, Gloucester GL2 6EE.

BUSINESS BOX

Sintrom Ellinor, part of the Sintrom group, are offering a complete LSI 11 chassis with power supply and twin tape transports. There is no computer in the box so it can act as the basis of an OEM system or you could go it alone with the DEC equipment and build a complete system. Sintrom will, of course, be happy to supply the bits to fill the chassis with as well. The tape drives are the TU58 cartridge type and are complete with the necessary controllers, they can be omitted from the chassis if not required. For information and prices contact Sintrom Ellinor at 14 Arkwright Road, Reading RG2 0LS.



The PIC-CHIP.... a powerful easy-to-use graphics facility for all New Rom PETs.

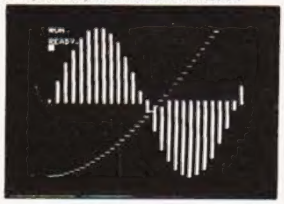
The PicChip is a ROM module which simply plugs into your PET making available immediately over forty new BASIC commands. These commands use BASIC variables as parameters (no PEEKing or POKEing) and enable the graphic possibilities of the PET to be fully exploited - even by beginners! Using an X, Y coordinate system based on an origin specified by program, lines, graphs and drawings of all kinds can be generated on the screen by simple programming. Other commands enable defined areas, or the whole of the screen, to be rolled or shifted up, down, left and right. Images can be stored to and retrieved from any RAM address.

Originally designed for **scientific** and **technical** applications, the PicChip is also being used in **educational projects, games** and **design work** of all kinds. The combination of fast plotting and area manipulation makes the PicChip ideal for the continuous display of real-time data in graphical form.

Just see how easy it is to use PicChip commands: the following examples were all photographed directly from a PET screen.

Picture 1 shows two curves, one drawn in fine-density and one in bar form, produced by two program lines:

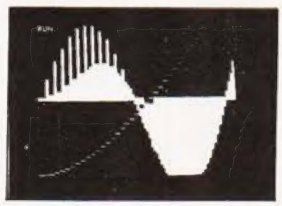
```
10 FOR X=0 TO 39:Y = X↑1.5:!WF:
NEXT
20 Y0=25:FOR X=0TO79 STEP 3:
Y=SIN(X/12)*24:!WY:NEXT
```



(1)

Picture 2 adds a third program line to plot a function as adjacent bars:

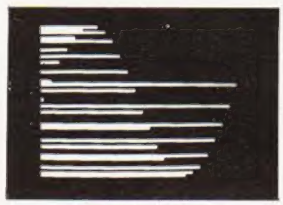
```
30 FOR X = 0 TO 79:Y=SIN(X/12)*
X/2:!WY:NEXT
```



(2)

If we just take the second program line and change !WY to !WX, the bars are plotted horizontally:

```
20 FOR X = 0 TO 79:Y=SIN(X/12)*24:
!WX:NEXT
```



(3)

All the other pictures reproduced here were generated by the DEMONSTRATION PROGRAM included in the 20-page Handbook. What we can't show here are the amazing effects produced by shifting or rolling or otherwise manipulating different areas of the screen. There is even a repeat-key function, and commands for reading and setting the cursor position in X,Y co-ordinates.

The standard PicChip plugs into socket UD4 of the PET, but is also available to fit either of the other two sockets. PicChip is therefore **compatible with other PET ROM packages.** Installation and use are fully described in the handbook.

The PicChip costs just £50 + VAT. To buy the handbook separately costs £5 but this may be offset against an eventual purchase of the chip. State required socket when ordering. 10% **discount to educational institutions.**

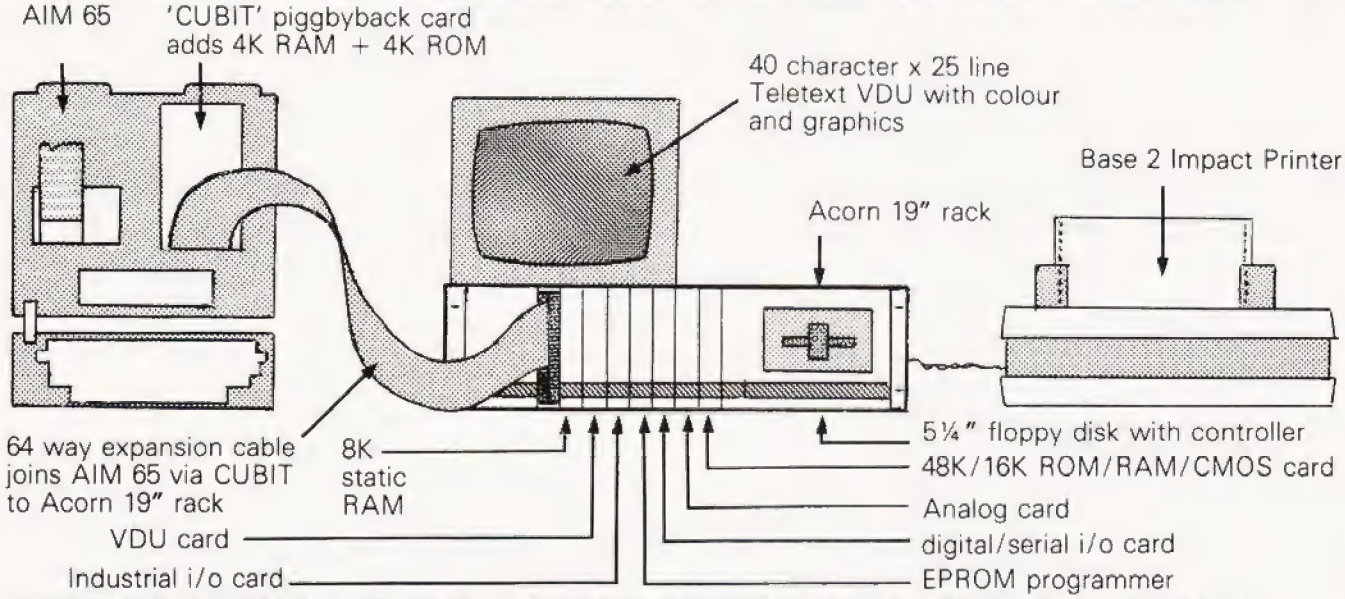
AIM 65 DANCES TO A NEW DISK!



£600 BUTS A COMPLETE SINGLE DISK EXTENSION TO THE AIM 65. Excluding V.A.T.

This is the first conveniently packaged AIM 65 disk system to be available, and in the same sensible Eurocard presentation it offers memory expansion, impact printer interface, colour VDU, EPROM programmer, digital and analog i/o, and more. In addition, the owner of this hardware can run Acorn software, which includes BASIC, disk assembler, word processor and business accounting, and can run a 6809 microprocessor card in the same rack.

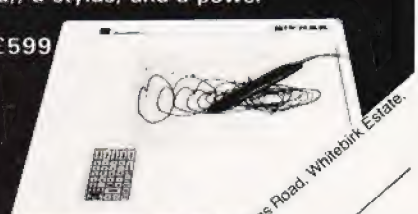
a digitizer adds another dimension

The Bit Pad computer digitizer converts graphic information into digital form for direct entry into a computer. By touching a pen like stylus or a cursor, to any position on a drawing, diagram, photograph, or other graphic presentation, the position co-ordinates are converted to digital equivalents.

- **Bit Pad has RS232 parallel or IEEE interfaces.**
- **Bit Pad consists of a 15" sq. digitizer tablet (11" sq. active area), a stylus, and a power supply.**
- **Bit Pad costs only £599 plus 15% VAT.**



PET USERS SAVE £100

AN IEEE BIT PAD CAN BE YOURS FOR ONLY £499* plus 15% VAT

*Offer ends 31st March 1981 – subject to availability.

Fill in the coupon for more details or send your order together with a cheque for immediate delivery

LE

LIFE ON A 6800

Edwin J Peffer

An interesting variant on the popular LIFE emulation specifically for 6800 owners. Designed for the SWT range it should prove adaptable to other 6800 based machines.

The program LIFE is a set of rules to define the growth or death of a moss-like form. It was devised by J Conway and and depends entirely on the number of "neighbours" that each cell has, as follows.

A 'live cell' with only two or three neighbours will remain alive, but if there are more or less than this it will die. An empty cell with three neighbours will result in a birth at the empty location. Whether this really proves anything is very doubtful but it is both interesting and amusing. The end result can fall into one of the following categories, a) the whole system dies, b) a stable pattern results (a square of four is an example of this) or, c) a cyclic pattern which goes through one or more generations before repeating. The best example of these that I have found starts as three solid rows of cells across the centre of the matrix and this eventually produces a cyclic pattern that takes 15 generations to repeat.

My first program for LIFE was written in BASIC for Hewlett-Packard 2000F and even on this machine it took 10 seconds per generation. There was a 10 x 10 matrix and the technique was to count the neighbours for every cell in order to determine the next generation, ie eight subscripted variables for each of 100 locations. I eventually realised that rather than count for *every* cell it would be quicker to zero a matrix and then add one to each neighbour of a *live* cell (still eight subscripted variables for each cell examined but considerably fewer cells to worry about. After this the counting matrix has a record of the number of neighbours for each cell and the appropriate symbol can be loaded into the printing matrix. This cuts down the time to approximately one second per generation, which was acceptable.

Then the college at which I teach bought a SWTP 6800 system and I modified LIFE to suit the slightly different BASIC. Due to the BASICs slowness in handling subscripted variables it takes an incredible 50 seconds per generation. Hence my decision to write a machine code version of LIFE.

Method

I settled on a 16 x 16 matrix although this can be increased or decreased quite easily. To simplify the printing it treats the whole matrix as a single string and uses the Mikbug/SWTbug routine PSTRING (E07E). Thus the string consists x's or .'s with every 17th and 18th item as 'return', 'linefeed' respectively and the last item is an 'end of string' (code 04). So the string is effectively folded back on itself as shown.

```
. . . . XXXXX . . . . ret,l/f . . . .
XXXXX . . . ret,l/f . . . . XXXXX
ret,l/f . . . . XX.ret,l/f,eot
```

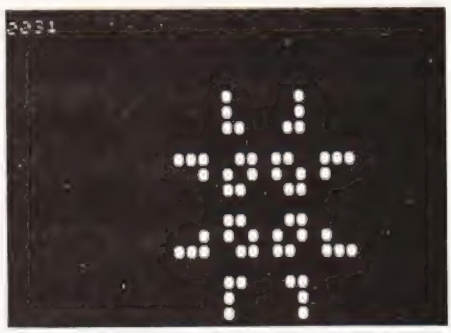
As you will see later the whole string gets modified by the calculation process and therefore before actually printing the string the 'return', 'linefeed', etc characters have to be added in again (program steps 017B to 01A6).

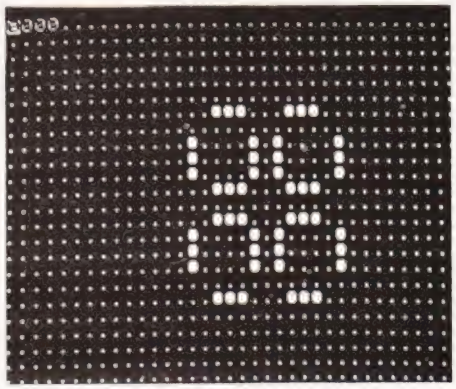
There have to be two matrices, Gen1 which is the present generation and Gen2 which is used to count the number of neighbours. The first stage in the calculation is to clear Gen2 (subroutine CLGEN2). Then it reads through Gen1 to find a live cell(X). When it does so it sets the index register to the corresponding cell in Gen2 (using subroutine XOFSET). It then has to add one to each of its eight neighbours as shown.

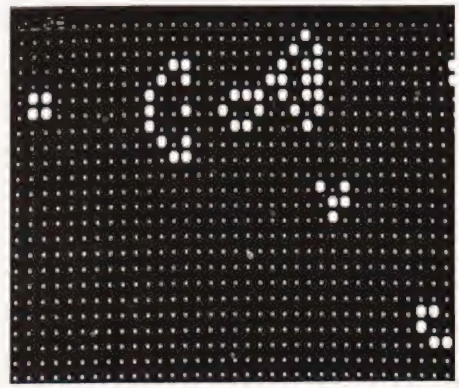
```
A  B  C
D  X  E
F  G  H
```

The index register holds the address of X but we cannot address A,B,C or D because indexed address offsets can only be positive, therefore (program steps 01BD to 01CF) it subtracts 19 so that the index register holds the address of A. Now we can increment the contents of A (as X), B (as X + 1), C as (X + 2), D as (X + 18) etc. It does not take into account the fact that edge cells should not affect eight neighbours, this is why the return, line-feed get overprinted and also why the isolation block is necessary. After this has been carried out for all of Gen1 then Gen2 contains the list of all the neighbours.

The subroutine NEWGEN is now used to load the next generation, taking into account how many neighbours and whether a cell is already alive or dead.







Note that once again it does not identify location 17 and 18 etc., and so they will have to be modified as described above. It then goes back and repeats from CLGEN2.

The input routine is possibly more complex than necessary but I have found it very frustrating in the past to run LIFE on a VDU and find an interesting sequence, but then realised that I hadn't noted the initial pattern. With my routine, it first clears the screen, then prints the message and then prints 27 blank spaces before accepting and printing each character as it is input. After 16 characters it gives 'return, linefeed' and 27 spaces etc. The result is that the initial pattern is offset 27 spaces to the right and remains there whilst leaving sufficient space for the main display to be watched. If you like the result then you still have a copy of the original pattern.

Finally, why the time delay? Well, it is so fast that on a 960 char/sec VDU the display is continually changing and can't really be seen. Counting down from FFFF gives a delay of about 1 S between generations. If you don't want the delay, replace 0116 and 0117 with 00 01.

This version of LIFE assumes a flat universe bonded by the edges of the matrix. A variation which could be added is to assume the opposite edges to be adjacent (similar to a Karnaugh map) so that the universe is a sort of sphere. It is, however, *not* a true sphere as the geometricians among you will have realised.

CLASSROOM COMPUTING?

With a price tag to suit the impoverished educational establishment and, as a by-product, attract the personal computer fan, the Acorn ATOM seems to be finding wide and rapid acceptance. Among the points often raised against it is the fact that the BASIC supplied is non-Microsoft, a criticism which implies that it might be difficult to program. Our reviewer has been spending time looking at just this aspect of the machine and he comes up with a number of very interesting conclusions. A review not to be missed if you are considering this computer for either your school or your home.

HAD AN ADVENTURE LATELY

Perhaps we should have given it a capital 'A' because the kind of adventure we're talking about is the computer-based game. If you are into the fantasy game market then don't spend your money until you've read this report on some of the best known offerings in the marketplace. The results will probably surprise you as much as they surprised us!

SOFTSPOT SPECIAL

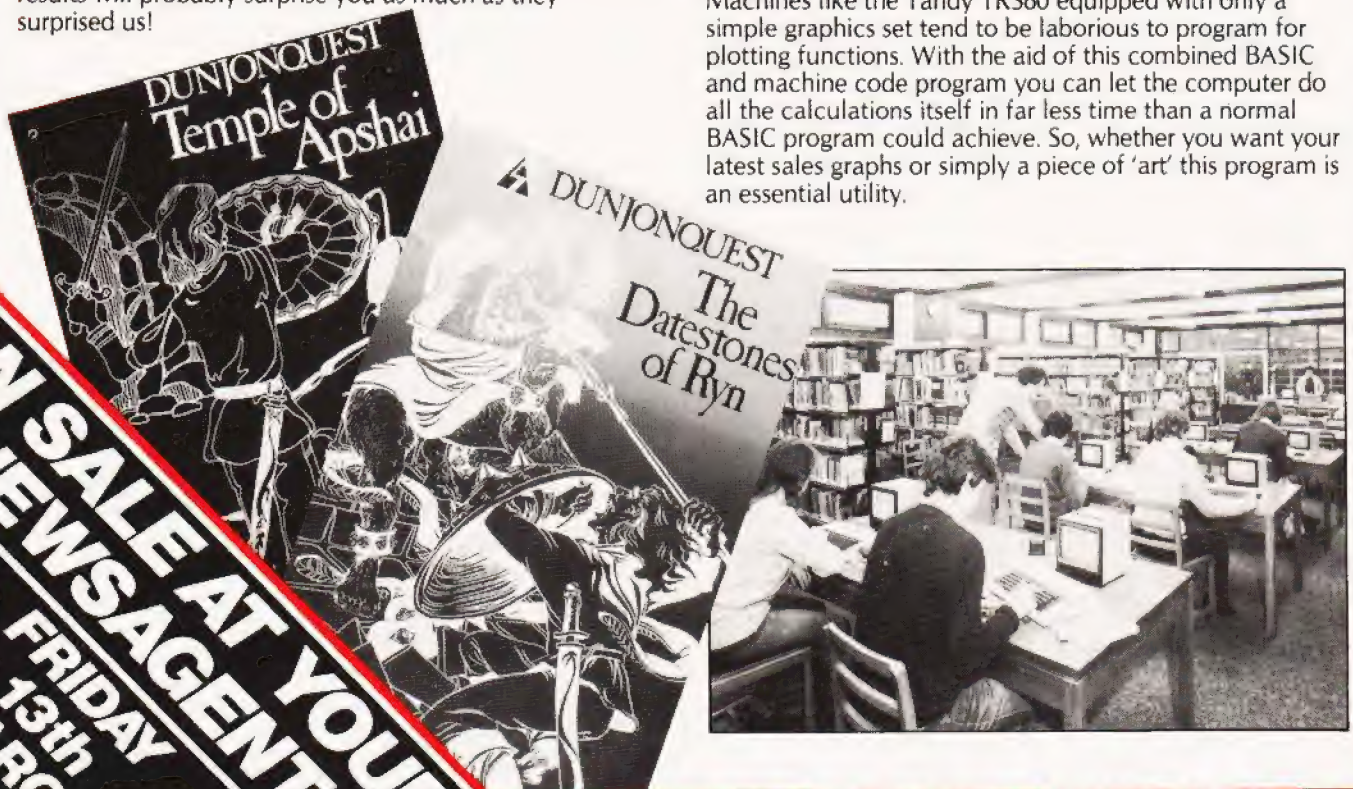
Once a year we turn the pages of the magazine over to the best of our readers' software offerings and this year is no exception. Applications, utilities, games and hints are all here for many of the popular microcomputers and, whatever machine you own, you're bound to pick up a few good ideas.

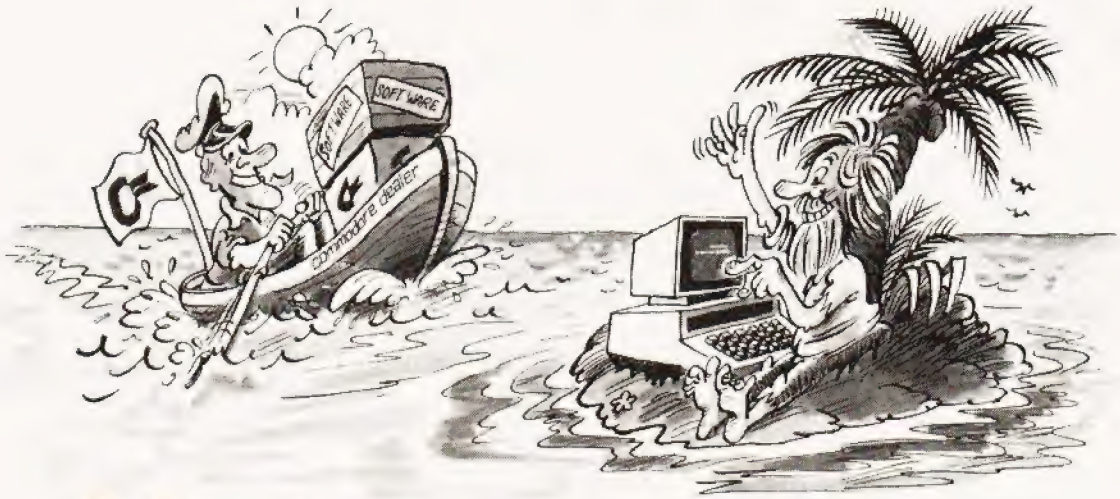
JUMPING ON THE BUSES

Motorola's challenger to the mighty Zilog Z80 is the 6809, the trouble is building it into anything. There are a few machines that offer the processor but the solution to this problem can be found in a rather old and neglected bus system called the SS50. We take a close look at what this has to offer together with some examples of the competition ranged against it.

DRAWING THE LINE

Machines like the Tandy TRS80 equipped with only a simple graphics set tend to be laborious to program for plotting functions. With the aid of this combined BASIC and machine code program you can let the computer do all the calculations itself in far less time than a normal BASIC program could achieve. So, whether you want your latest sales graphs or simply a piece of 'art' this program is an essential utility.





You're never alone with a Commodore PET

If you buy just any make of microcomputer you could find yourself on your own. And that's serious. Because without first class software and support, all you're left with is a box of wires.

On the other hand, when you buy Europe's No.1 microcomputer, the Commodore PET, you have access to the largest and finest range of software in the UK today; the most experienced dealer network; 24 hour field maintenance service; plus our very own training courses and user's club – all to ensure that you get the best from your system.

But how can Commodore offer so much? Well, we've been in the high technology business for over 20 years, whereas many of our competitors have just started out. We even manufacture the silicon chips for other microcomputers. This enables us to keep our costs to you down, so you can buy a self-contained PET for £450, or a complete business system from as little as £2,000 (+ VAT).

Of course, you could buy a box of wires for about the same price. But all you'll get from our dealers is sympathy.

Jim McCartney

The Sinclair ZX80 has really been bringing out the best in programmers. One popular technique is to use Boolean algebra and we show you how to make the logic work.

One of the advantages of owning a ZX80 with only 1K of memory is that you soon learn a lot about economical programming. You will have noticed that by the time you get to about the fortieth line, your listing starts to shrink in a rather distressing way, thus indicating that you are also using up your display memory as well.

This is especially noticeable when you are restricted to one statement per line, as on the ZX80, because if you have more than one instruction following an IF . . . THEN you will be forced to use several lines for them

A Case In Point

Consider the situation where you want a variable to change between 0 and 1 alternately as the line is executed. This usually occurs when you are playing games and want to use 'turns'. The flowchart for this would be something like Fig. 1.

If we had a machine that could handle multi-statement lines then we could write:

```
10 LET F=0

80 IF F=0 THEN LET F=1:GOTO 200
90 LET F=0
```

The extra statement on line 80 is only executed if the previous condition is met,

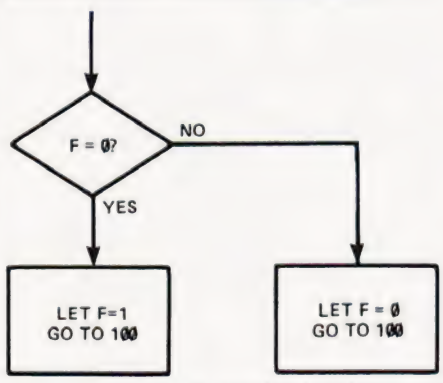

Fig.1. The alternate branch flowchart.

but you can't do this on the ZX80 so we have to have line 200 setting F=1. All this takes up valuable memory space. This sort of operation and more besides can be taken care of using Boolean or logical statements.

AND And OR

As well as the usual arithmetic operators, we have a number of logical operators available which work on the actual machine code numbers stored inside the computer. The AND function will only leave a bit set in the result if the corresponding bit is set in *both* the words under comparison. Figure 2 gives the truth table for a typical operation.

The OR operator works in a similar way except that it will leave a bit set if it has occurred in *either* of the words under comparison, Fig. 3 gives an example. There is also a NOT function which turns all the 1s into 0s.

If we generate a table for both of these functions we can see that a simple connection emerges;

1 AND (any odd number) = 1
1 AND (any even number) = 0

If, for example, we wanted a variable to increment in steps of one to a maximum of three and then reset itself we could simply write,

```
LET F=F+1 AND 3
```

In fact we could use any value of 2^n-1 instead of three. It is also worth noting that X AND 0=0 where X is any number and that X OR 0=X where X is any number.

We can now see a couple of other ways of writing that alternating branch, each of which saves us a line.

```
10 LET F=0

80 LET F=F+1 AND 1
90 IF F=1 THEN GOTO 200
```

or we could try,

```
80 LET F=F+1
90 IF F AND 1=1 THEN GOTO 200
```

The Power Of Logic

The sheer power of this type of logic doesn't become obvious until we realise that each comparison we make is assigned the value of −1 if true and 0 if false. Using two-byte integer arithmetic, as the ZX80 does, we know that −1 is represented as 1111111111111111 and so the following is true, X AND −1=X. However, as −1 is already the truth value it follows that:

X AND (a true statement)=X
X AND (a false statement)=0

If we write the code LET F=F=0 AND X where the initial value of F is 0 the following pattern is produced X0X0X0X0 . . .

We can now re-write the loop code in a further two ways;

```
10 LET F=0

80 LET F=F=0 AND 1
90 IF F=1 THEN GOTO 200
```

or, alternatively,

```
80 LET F=F=0 AND 100
90 GOTO F+100
```

DECIMAL	BINARY
10	1010
AND 6	0110
= 2	0010

Fig.2. The AND function.

DECIMAL	BINARY
10	1010
OR 6	0110
= 14	1110

Fig.3. The OR function.

AND	0	1	2	3	4	5	6	7
0	0	0	0	0	0	0	0	0
1	0	1	0	1	0	1	0	1
2	0	0	2	2	0	0	2	2
3	0	1	2	3	0	1	2	3
4	0	0	0	0	4	4	4	4
5	0	1	0	1	4	5	4	5
6	0	0	2	2	4	4	6	6
7	0	1	2	3	4	5	6	7

OR	0	1	2	3	4	5	6	7
0	0	1	2	3	4	5	6	7
1	1	1	3	3	5	5	7	7
2	2	3	2	3	6	7	6	7
3	3	3	3	3	7	7	7	7
4	4	5	6	7	4	5	6	7
5	5	5	7	7	5	5	7	7
6	6	7	6	7	6	7	6	7
7	7	7	7	7	7	7	7	7

Fig.4. The comparative truth tables.

This type of instruction becomes even more powerful if we have more than two options, consider the following.

```
50 IF X < A THEN LET F = 100
60 IF X = A THEN LET F = 200
70 IF X > A THEN LET F = 300
80 GOTO F
```

Using our new found knowledge we can write

```
50 LET F = X < A AND 100 OR X = A
   AND 200 OR X > A AND 300
80 GOTO F
```

An example like this is given in the ZX80 manual but there is no indication of how and why it works. In the example above we use both the AND and the OR functions but it should be remembered that ANDs are always executed before ORs. With an extension of this technique we can make a variable alternate between two values on a single line,

```
LET F = F = X AND X OR F = Y AND X
```

The Reversible Subroutine

Some of the above examples prove to be 'reversible lines' and this technique can be expanded to give complete subroutines with a bit of care. The function of the routine is to carry out the complete opposite of its previous function on alternate passes.

An example of this is given in the short but aggravating game listed below. In this case we have gained several lines and thus fitted rather more into 1K than expected

The game starts with 11 counters in the display and your task is to split the line of counters in such a way as to leave two lines of different lengths. The last player to be able to do this wins the game. For example a line of four counters may be split 'three and one' but not 'two and two'. The computer takes the second move.

The game strategy is given in lines 340 and 350, the number of lines containing three, six or nine and the number of lines containing five or eight must both be even for a winning 'leave'. The tests are made in the above lines and if both F and G are zero then the machine has found a winning 'leave' and finishes its turn. If it can't, then it sets H equal to 1 (line 420) and it takes the first available move, line 300.

The program for the machine's turn works by examining all possible moves in the double loop between 250 and 400. The array is re-distributed by line 290 and subroutine 700 and is then tested in lines 330 to 370. If a satisfactory result isn't found the array is put back as it was by line 380 and the next possible move is tested.

In the reversible subroutine, lines 700 to 760, the variable N(X) alternates between the values of Y and Y + Z. The K loop looks for the first vacant array space and puts the counters (Z) taken from N(X) into the space. When we leave the loop at line 730 the K value stays where it is. The next time round we skip the loop entirely, line 710, and use this K value to find the counters and put them back again.

The Proof Of The Pudding

If you don't believe that Boolean algebra can be this effective then just try to re-write this program in 1K without it! The game itself is a mathematical variant of NIM and was invented by a mathematician called Grundy. It is actually called Distich and it can be played with any number of lines or piles of any number of counters. The winning strategy depends on leaving an even quantity of 'Grundy' numbers (F and G in this example) for your opponent. Given that number 11 is itself a Grundy number you can amuse yourselves by trying out more complicated versions.

Program Listing

```
100   CLEAR

Why the Sinclair ZX80 is Britain's best-selling

Built: £99.95

Including VAT, post and packing, free course in computing, free mains adaptor.

Kit: £79.95

Including VAT, post and packing, free course in computing.

This is the ZX80. A really powerful, full-facility computer, matching or surpassing other personal computers at several times the price. 'Personal Computer World' gave it 5 stars for 'excellent value'. Benchmark tests say it's faster than all previous personal computers.

Programmed in BASIC – the world's most popular language – the ZX80 is suitable for beginners and experts alike. And response from enthusiasts has been tremendous – over 20,000 ZX80s have been sold so far!

Powerful ROM and BASIC interpreter

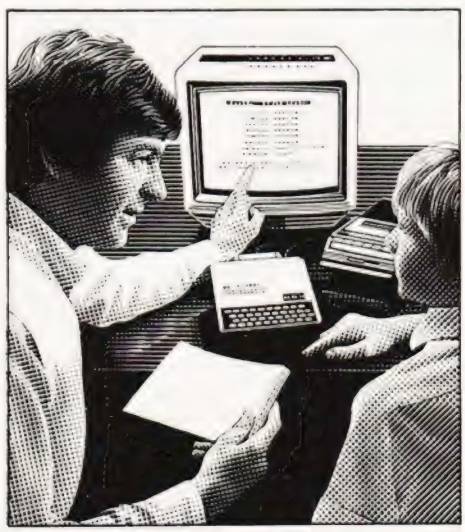
The 4K BASIC ROM offers remarkable programming advantages:

* Unique 'one-touch' key word entry: the ZX80 eliminates a great deal of tiresome typing. Key words (RUN, PRINT, LIST, etc.) have their own single-key entry.
* Unique syntax check. A cursor identifies errors immediately.
* Excellent string-handling capability – takes up to 26 string variables of any length. All strings can undergo all relational tests (e.g. comparison).
* Up to 26 single dimension arrays.
* FOR/NEXT loops nested up to 26.
* Variable names of any length.
* BASIC language also handles full Boolean arithmetic, condition expressions, etc.
* Randomise function, useful for games and secret codes, as well as more serious applications.
* Timer under program control.
* PEEK and POKE enable entry of machine code instructions.
* High-resolution graphics.
* Lines of unlimited length.

Unique RAM

The ZX80's 1K-BYTE RAM is the equivalent of up to 4K BYTES in a conventional computer – typically storing 100 lines of BASIC.

No other personal computer offers this unique combination of high capability and low price.



The ZX80 as a family learning aid. Children of 10 years and upwards are quick to understand the principles of computing – and enjoy their personal computer.

The Sinclair teach-yourself BASIC manual

If the specifications of the Sinclair ZX80 mean little to you – don't worry. They're all explained in the specially-written 128-page book (free with every ZX80). The book makes learning easy, exciting and enjoyable, and represents a complete course in BASIC programming – from first principles to complex programs.

Kit or built – it's up to you

In kit form, the ZX80 is pleasantly easy to assemble, using a fine-tipped soldering iron. And you may already have a suitable mains adaptor – 600 mA at 9V DC nominal unregulated. If not, see the coupon.

Both kit and built versions come complete with all necessary leads to connect to your TV (colour or black and white) and cassette recorder. Plug in and you're ready to go. (Built versions come with mains adaptor.)

personal computer.

Now available for the ZX80...
New 16K-BYTE RAM pack

Massive add-on memory. Only £49.95.
The new 16K-BYTE RAM pack is a complete module designed to provide you – and your Sinclair ZX80 – with massive add-on memory. You can use it for those really long and complex programs – or as a personal database. (Yet it can cost as little as half the price of competitive add-on memory for other computers.)

For example, you could write an interactive or 'conversational' program to show people what your ZX80 can do. With 16K-BYTES of RAM, they could be talking to your computer for hours!

Or you can store a mass of data – perhaps in a fairly simple program – such as a name and address list, or a telephone directory.

And by linking a number of separate programs together into one giant, but modular, program, you can achieve the same effect as loading several programs at once.

We're also confident that it won't be long before you can buy cassette-based software using the full 16K-BYTE RAM. So keep an eye on the personal computer magazines – and brush up your chess perhaps!

The RAM pack simply plugs into the existing expansion port on the rear of the ZX80. No wires, no soldering. It's a matter of seconds and you don't need another power supply. You can only add one RAM pack to your ZX80 – but with 16K-BYTES who could want more!

How to order

Demand for the ZX80 exceeds all other personal computers put together! So use the coupon to order today for the earliest possible delivery. All orders will be despatched in strict rotation. We'll acknowledge each order by return, and tell you exactly when your ZX80 will be delivered. If you choose not to wait, you can cancel your order immediately, and your money will be refunded at once. Again, of course, you may return your ZX80 as received within 14 days for a full refund. We want you to be satisfied beyond all doubt – and we have no doubt that you will be.

A really neat little game in NASCOM BASIC that could be easily modified to use the recently published joysticks.

This program was written for an 8K NASCOM 1 using the T4 monitor with the 8K ROM BASIC and the NAS-GRA-V3 graphics ROM. With suitable modification it would be possible to run this program under NAS-SYS.

You are sat at the controls of a rebel Star-fighter. Your mission is to seek out and destroy as many rogue Eti-fighters as possible within the confines of the energy reserves available.

To steer your fighter the following four keys on the NASCOM keyboard are used:

–	. . . UP
@	. . . LEFT
BACKSPACE	. . . RIGHT
NEW-LINE	. . . DOWN

Only one key may be pressed at any one time until you fire the LASER which is activated by depressing all your four keys at once. It must be remembered that you are steering towards the Eti-fighter and it may seem, at first, to be back to front.

A double bar at each end of the sight indicates that a target is present within the sight, or that the LASER is recharging. Angled brackets signify that the target is central within the sight.

You start out on your mission with 500 units of energy, on each burst of LASER fire you consume 10 units of energy.

A score of 10 points is awarded for a hit on the main hull of the Eti-fighter, whereupon a hopefully satisfying explosion will ensue. To gain additional marks, a point is given for every stabilising fin which is shot off. There are four fins in all, two per wing, giving a possible score of 14.

When your energy has been exhausted, an appropriate comment will be printed, this being dependent on *your* performance. If your score has exceeded the best recorded score, the program will invite you to enter your name which will be displayed beside your score until this, in turn, is exceeded.

With only minor modifications to the subroutine at line 7000 onwards, it would be possible to use this program with a Joystick interface, perhaps even with a trigger to fire the LASER (Line 170).

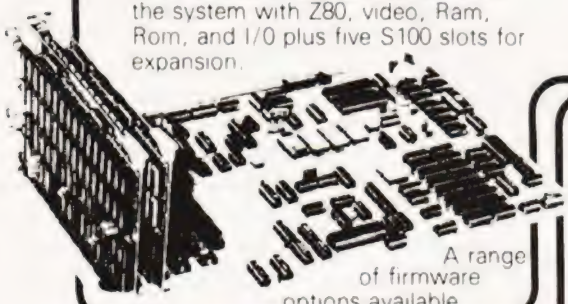
NEW THE TUSCAN S100

A Z80 based S100 Computer System.

Available in Kit Form or Assembled. All components available separately.

TUSCAN main board. The heart of the system with Z80, video, Ram, Rom, and I/O plus five S100 slots for expansion.



A range of firmware options available.

Houses two 5¼" drives for a compact business system
Professional case will house the complete system
Two keyboard options
Hinged lid for easy access
Stylish finish ideal for office or home

Ex-Stock

On Demonstration NOW

KITS from £235 + VAT

Complete business sytem. 48K two 5" drives **£1481.00.**

NASCOM PRODUCT LIST + VAT

I/O board kit less I/O chips	45.00
UART + BAUD rate generator + crystal for I/O board	16.00
Econographics kit for additional 128 characters (N1 only)	30.00
2708/2716 Programmer suitable for N1 and N2 under NAS-SYS	£20.95
Nascom 19" rack mounting card frame for N1 and N2	32.50
Nas-DA disassembler 3 EPROM for Nas-sys	37.50
MK36271 8K BASIC in 8K x 8 ROM	
Naspen VS in 2 EPROM	30.00

nascom-2 MICRO-KIT COMPUTER

WITH IMPROVED 16k B RAM Board

POWER SUPPLY £29.50

only £335 + VAT

Full after sales service

Firmware & MOS ICs Software

Zeap Assembler (4, 1Kx8 EPROMS) £50

Nas Pen text editor (2, 1Kx8 EPROMS) £30

Expansion boards (in kit form)

48K RAM £210 ● 32K RAM £175.00

16K RAM £140

EPROM CARD (NASCOM compatable) KIT. Suitable for 16 x 2708 or 16 x 2716 or mixed 1 x NASCOM 8k BASIC ROM £55.00. BASIC programmers aid. Self locating tape £14.95.

THE HENELEC DISK SYSTEM FOR NASCOM and any other Z80 8080 Microcomputer with an uncommitted P10

DISKS

- The Henelec controller card plugs direct into a Z80 P10 and controls up to **3 double-sided mini-floppy drives giving a maximum 480K system.**
- **General Purpose FDC control software for simple DOS or for CPM.**
- **Simple DOS software for NASCOM 1/2 under NAS-SYS**
- **OR** ROM CB10S for CPM on NASCOM 1/2 incorporating the major NAS-SYS features. Maximum 60K CPM system
- New MD prom supplied for N2/CPM

TWO SYSTEMS

- **SIM-DOS "Floppy Tape Recorder" with 1 drive PSU firmware, etc. Double sided £380 plus VAT**
- **CPM System with 1 drive, double sided PSU firmware, etc. £450 plus VAT**
- **Additional Drives with PSU £205 plus VAT**

TANGERINE

COMPUTER SYSTEMS

"MICRON" the latest line in superb products on demonstration from your London stockist

EX-STOCK **£395.00 inc. VAT BRITISH DESIGN**

- 6502 based microcomputer
- VDU alpha numeric display
- Powerful monitor TANBUG
- 8K RAM
- 32 parallel I/O lines
- 2 serial I/O lines
- RS 232 C/20mA loop, with 16 programmable Baud rates
- Four 16 Bit counter timers
- CUTS cassette recorder interface
- Data bus buffering
- Memory mapping control
- 71 Key ASCII Keyboard, including numeric keypad and with auto repeat
- Including metal cabinets for both keyboard and modules
- Including power supply 10K Microsoft BASIC

NASCOM-1

12" x 8" PCB carring 5LSI MOS packages, 16 1K MOS memory packages and 33 TTL packages. There is on-board interface for UHF or unmodulated video and cassette or teletype. The 4K memory block is assigned to the operating system and video display leaving a 1K user RAM. The MPU is the standard Z80 which is capable of executing 158 instructions including all 8080 code.

Built price £140 + VAT.

Nascom-1 Kit Price £125 Plus VAT + P&P £1.50

NASCOM IMP

PLAIN PAPER PRINTER £325

Fully built and housed in a stylish enclosure for just **£325** plus VAT.

INTERFACES WITH ALL MICRO COMPUTERS

The Nascom IMP (Impact Matrix Printer) features are

60 lines per minute 80 characters per line
● Bi-directional printing ● 10 line print buffer
● Automatic CR/LF 96 character ASCII set (including upper/lower case, $, £) ● Accepts 8½" paper (pressure feed) ● Accepts 9½" paper (tractor feed) ● Tractor/pressure feed. Baud rate from 110 to 9600 ● External signal for optional synchronisation of baud rate.

IDEAL FOR WORD PROCESSING

Professional ASCII Keyboards

ONLY £29.95 SCOOP

The 'APPLE' Computer Keyboard

- 52 KEY 7 BIT ASCII CODED
- POSITIVE STROBE +5V–12V
- FULL ASCII CHARACTERS
- PARALLEL OUTPUT WITH STROBE
- POWER LIGHT ON CONTROL
- NATIONAL mm 5740 CHIP TTL OUTPUT
- SUPERBLY MADE. SIZE 12x5.5x1.5ins
- BLACK KEYS WITH WHITE LEDGENS
- ESCAPE SHIFT RETURN & RESET KEYS

Complete with CIRCUIT & DATA

Ideal for use with TANGERINE TRITON APPLE & most computers

Ex-Stock from HENRY'S

A GREAT DEAL FROM 6 NASCOM DEALERS

and guaranteed after-sales service

BUILT FLOPPY DISC SYSTEM FOR NASCOM 1/2 FROM £395+VAT

It's here at last. A floppy disc system and CP/M.

CP/M SYSTEM.
The disc unit comes fully assembled complete with one or two 5¼" drives (FD250 double sided, single density) giving 160K per drive, controller card, power supply, interconnects from Nascom 1 or 2 to the FDC card and a second interconnect from the FDC card to two drives, CP/M 1.4 on diskette plus manual, a BIOS E. ROM and new N2MD PROM. All in a stylish enclosure.

Nascom 2 Single drive system. £450 - Vat
Nascom 2 Double drive system £640 - Vat
Nascom 1 Single drive system. £460 - Vat
Nascom 1 Double drive system £650 - Vat
Additional FD250 drives ..... £205 - Vat

D-DOS SYSTEM
The disc unit is also available without CP/M to enable existing Nas-Sys software to be used. Simple read, write routines are supplied in EPROM. The unit plugs straight into the Nascom PIO.

Single drive system ..... £395 - VAT
(please state which Nascom the unit is for)

Certain parts of the CP/M and D-DOS disc systems are available in kit form. Details available on request.

ENCLOSURE FOR N2+5

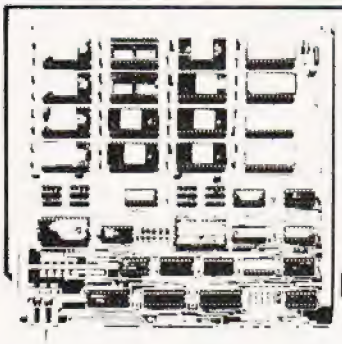
The Kenilworth case is a professional case designed specifically for the Nascom 2 and up to five additional 8" x 8" cards. It has hardwood side panels and a plastic coated steel base and cover. A fully cut back panel will accept a fan, UHF and video connectors and up to 8 D-type connectors. The basic case accepts the N2 board, PSU and keyboard. Optional support kits are available for 2 and 5 card expansion.

Kenilworth case £49.50 - Vat
2-card support kit £7.50 - Vat • 5-card support kit £19.50 - Vat

INTERFACE ENHANCING UNIT

The Castle Interface is a built and tested add-on unit which lifts the Nascom 2 into the class of the fully professional computer. It mutes spurious output from cassette recorder switching, adds motor control facilities, automatically switches output between cassette and printer, simplifies 2400 baud cassette operating, and provides true RS232 handshake.

Castle Interface Unit . **£17.50** - Vat



EPROM EXPANSION

The Nasbus compatible EPROM board accepts up to 16,2708 or 2716 EPROMs. It has a separate socket for the MK36271 8K BASIC ROM for the benefit of Nascom-1 users. And for Nascom-2 users, a wait state for slower EPROMs. The board also supports the Nascom Page Mode Scheme.

EPROM Board (kit). . . . . £55 + VAT
EPROM Board (built & tested) £70 + VAT

A-D CONVERTER

For really interesting and useful interactions with the 'outside world' the Milham analogue to digital converter is a must. This 8-bit converter is multiplexed between four channels - all software selectable. Sampling rate is 4KHz. Sensitivity is adjustable.

Typical applications include temperature measurement, voice analysis, joystick tracking and voltage measurement. It is supplied built and tested with extensive software and easy connection to the Nascom PIO.

Milham A-D Converter (built and tested) **£49.50** - Vat

NASCOM-2 Microcomputer Kit £225 - Vat
NASCOM-1 Microcomputer Kit £125 - Vat
Built & tested £140 - Vat
IMP Printer, Built & tested ..... £325 - Vat

All prices are correct at time of going to press

PROGRAMMER'S AID.
For Nascom ROM BASIC running under Nas-Sys. Supplied in 2x2708 EPROMs. Features include: auto line numbering, intelligent renumbering, program appending; line deletion; hexadecimal conversion; recompression of reserved words; auto repeat; and printer handshake routines. **Price £28 - Vat.**

DUAL MONITOR BOARD. A piggy-back board that allows N1 users to switch rapidly between two separate operating systems. **Price (kit): £6.50 - Vat.**

BASIC PROGRAMMER'S AID.
Supplied on tape for N1/2 running Nas-Sys and Nascom ROM BASIC. Features include auto line number, full cross-reference listing, delete lines, find, compacting command, plus a comprehensive line re-numbering facility. **Price: £13 - Vat.**

PROM-PROG MKII.
2708 (multi-rail) and 2716 (single-rail) EPROM programmer kit controlled by N1/2 PIO. Supplied with comprehensive software for use with Nas-Sys. **Price: £25.95 - Vat.**

All the products are available while stocks last from the Nascom dealers below.
(Mail order enquirers should telephone for delivery dates and post and packing costs.) Access & Barclaycard welcome.

BARCLAYCARD

A P Stephenson

Does your computer use a 6502? If so, then this new series on machine code programming is for you.

There is no great shortage of literature on machine code programming. There are many books and a goodly assortment of magazine articles which are expertly written, particularly with reference to the 6502 microprocessor. In spite of this, the number of computer hobbyists who survive the first few chapters is very small; the majority slowly return to the peace and warmth of BASIC. There must be various reasons for this, the most probable is the tendency of writers to commence with a few soothing remarks, reassuring us that machine code programming is not *really* difficult. Now any one who is a dedicated hobbyist, whatever the subject, is seldom put off by a little thing like "difficulty".

It is common sense to realise at the outset that machine code programming is not easy. It is laborious. It is mind bending. In fact it is probably the most frustrating mental torture ever thrust upon the mind of man. Once this is established, if you try hard but still fail there is no nagging worry at the back of your mind that your intellect is suspect.

The examples which come later are quite unpretentious and may even be regarded as naïve. Nevertheless, they must be judged as building bricks which can be slotted together to produce useful programs or subroutines. The emphasis throughout is on the PET but, in general, most of it is applicable to other 6502 based machines except, of course, references to particular address blocks and screen memory. The appropriate modifications can be made by consulting the memory mapping.

The 6502 itself is worth a few remarks. Is it "better" than say the 8080 or the 6800 or the Z80? The question is really not worth answering except to say that the best micro is the one *you* know. The feature of the 6502 which I find the most frustrating is the single accumulator and the fact that you can't increment it directly . . . a most amazing omission, although no doubt the designers would have a ready explanation. On the other hand the multiple addressing modes and the two index registers are useful assets. Post-indexed and pre-indexed indirect addressing is available although the necessity to occupy page zero addresses (which are almost completely dominated by the BASIC software workspace) severely restricts their use. It is not essential to write an entire program in machine code. It is easy to write part of a program in some high level language (such as BASIC) and nip smartly into a machine code subroutine whenever a speed or memory preservation problem arises.

Which Machine Code?

BASIC is a universal language, meaning that any make of computer which has a resident interpreter will be able to understand a program written in BASIC . . . apart from a few fairly trivial modifications to suit differences in dialect. This is not so with machine code programs. The central processor of a small computer is a MICROPROCESSOR and each particular make has its own *unique* machine code. Thus a machine code program written for one computer will only run on another make of computer if it happens to use the *same* microprocessor.

Fortunately, a knowledge of the detailed anatomy of the machine is not required. Nevertheless, it is necessary to be aware of:

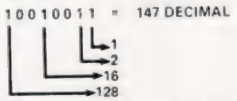
a. The major REGISTERS in the machine which are available to the programmer, particularly their length (can they hold one byte or two bytes?).

b. The safe areas in the memory map for the storage of machine code, ie where it will be safe from the conflicting claims of the BASIC monitor or any other resident software.

c. The machine addresses of any hardware input/output ports.

Theoretical Knowledge

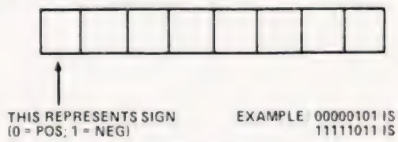
If you are already at home with binary and hexadecimal then the following will not interest you. *Binary* is a method of counting in animal grunts of "1" and "0" called BITs. A collection of bits can represent a number by assuming that the value of a "1" doubles each time it "moves" to the left. Thus,



How binary is "weighted".

A collection of eight bits is called a byte and this is the width of one memory cell in the 6502 family.

When addition or subtraction instructions are used, the computer assumes the number is in this format:



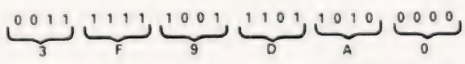
Using the MSB to indicate the sign of a number.

The +5 above is easy to follow but the negative relies on a funny rule . . . in fact hilarious;

To produce the equivalent negative, invert *all* the bits and *add* 1. Although this is absurd for humans, the machine is able to perform arithmetic very efficiently and with the minimum of electronic circuitry.

Hexadecimal

This is a shorthand code to describe a string of bits, although some arithmetic significance is also implied. It is widely used in computer literature and has almost superseded an earlier system called octal. There are 16 characters in the code . . . 0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F. The letters A to F are used to represent 10 to 15 respectively. The code is easy to grasp by study of the following example, which is based on bytes but artificially separated into four-bit NIBBLES to assist comprehension.

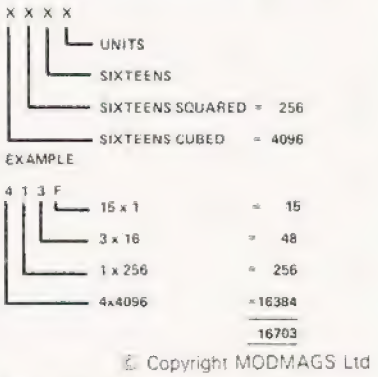


Breaking bytes into nibbles gives Hex quickly.

It is seen that one byte can be described concisely by just two Hex digits. When writing in machine code, addresses of individual memory cells are assumed by the system to be in Hex rather than decimal. An obvious criticism here would be a charge of unnecessary obscurity but, in reality, it is (in some respects) an advantage. The address bus

6502 PROGRAMMING COURSE

of a microprocessor has 16 wires and there are 2^{16} ways of arranging "1s" and "0s". Now this is equal to 65,536 decimal so the possible address range is from 0 to 65,535 which, frankly, is a disagreeable sort of figure rather lacking in taste. However, the same address range in four Hex digit notation is 0000 to FFFF which is neater and far more refined . . . don't you think? It is worth understanding how we count in Hex. Each Hex digit goes up in powers of SIXTEEN as we proceed from right to left in accordance with the following plan:



Hex weighting values revealed.

As an exercise, satisfy yourself that FFFF Hex = 65,535. It is customary to break down the memory space into BLOCKS of four kilobytes, PAGES of 256 bytes and ITEMS within each page. Thus the total memory space can be divided (mentally) into 16 blocks, each of 16 pages with 256 items in each page.

Monitors And Assemblers

There are three methods of entering a machine code program depending on the computer, the money available to buy support aids and the personality of the programmer. If you don't have a resident monitor in ROM (or a tape loaded monitor) you can use a series of POKEs . . . if your version of BASIC has POKE in its repertoire.

A machine code monitor is one of the traditional techniques for conveniently entering and running machine code programs. It is basically a program written in machine code itself and provides facilities for entering machine code, displaying the contents of any desired block of memory bytes, executing the program from a specific starting address, displaying the contents of the major registers, saving and loading the program on tape (or other kind of backing store) and last, but not least, steer a course for "home" and return to the shelter of mother BASIC. Some computers have monitors resident in ROM and others require the purchase of a tape or disk which will require loading. An ASSEMBLER is a more convenient way to aid the machine code programmer and is a more sophisticated example of support software. Because of the length of an assembler, few small computers can waste the memory space required to house it in a ROM. The superior qualities of an assembler can only be appreciated by comparison with a machine code monitor. The major advantage is the ability to use letter groups for the operation code instead of hexadecimal characters. The letter groups are chosen to provide memory association (human memory that is) with the effect they produce. For example, to increment the index register X (add 1 to it) the machine code in the 6502 is "E8". An assembler would allow the use of "INX" which is easily converted in the mind to "increment index register X". Another useful property is the use of labels (chosen by the programmer) to replace machine addresses and, in some cases, to replace the destinations in branch type instructions.

However, it must not be though that an assembler makes machine language programming easy. In fact, it is just as difficult to program with the assembler as it is with the machine monitor. All an assembler does is to make machine programming less error prone and easier to correct for mistakes, providing you know where they are! A simple (almost crude) "mini assembler" is provided later in this series. Some readers may find it useful.

The PET Monitor

This is given the homely name of "TIM" meaning Terminal Interface Monitor. Owners of the 8K PETs are unlucky because they have to buy it separately on cassette tape. Those with the 16K or 32K with new ROMs have TIM resident and can enter its clutches by typing SYS 1024 followed by RETURN. To those unused to it, the effect is rather an anti-climax because a rather motly string of characters are displayed which later on may take on some meaning.

```
PC  SR  AC  XR  YR  SP
C6  ED  00  20  00  F5
```

(With some machines an extra group IRQR appears)

PC stands for PROGRAM COUNTER, SR for PROGRAM STATUS REGISTER, AC for ACCUMULATOR, XR for INDEX REGISTER X and SP for STACK POINTER. Beneath each of the headings is a pair of hexadecimal digits which represent the current contents of the register and this will therefore not necessarily match the previous example contents. The presentation after typing SYS 1024 is said to "default to the REGISTER DISPLAY mode". The word "default" is used glibly in many manuals and textbooks but is seldom explained. It is a jargon term (and badly chosen jargon at that) in the computing world implying "a state to which a system reverts in the absence of specific commands to the contrary". Thus we didn't ask for a display of the registers TIM thrusts it upon us.

Although the facilities offered by TIM are laid out in the PET manual perhaps the following provides additional help to those who found it read somewhat like an early Sanskrit manuscript. Firstly, all input and output numbers to TIM are in Hex. Spaces are important and TIM will reject if a space is missing or if you type a space where there shouldn't be one. The prompt from TIM is a "." which is expected to be followed by any one of the letters M,R,G,X,L,S depending on the desired facility. These are all given in Table 1.

Putting It To Use

This completes the initial skirmish with the machine code monitor. Only one irritating little worry remains how do we know what bytes to put in the address? In other words, how do we write a program in machine code? As previously mentioned, the first essential step is to search through your bundle of documents to find a copy of the Machine Codes appropriate to the microprocessor used. PET owners who find that their manual does not include such "luxuries" are advised to cough up about £5.00 and purchase a copy of the "MOS 6500 Programming Manual". Sadly, it is not too kind to the poor old beginner and does little to encourage a desire to learn machine code. The accompanying "6502 Machine Code" tables are my attempt at such a classification which I use propped up in front of me during bouts of coding next to the bottle of aspirins. The contents of each little box displays three items of information:

a. Small figure at top left is the NUMBER OF BYTES in the instruction.

b. The letter groups at the bottom are the ASSEMBLER MNEMONIC CODES

c. The two large characters at right are the HEXADECIMAL MACHINE CODES.

DISPLAY MEMORY CONTENTS (Function "M"). Type after the prompt, .M 0340,0348 (don't forget the space after the M).
On pressing RETURN the monitor will output something like,

```
.:0340  A2  45  38  B4  E5  AA  AA  F9
.:0348  36  69  EF  57  D4 79   24   48
```

```
.M FF40,FF48
.:FF40 C8 C0 10 F0 C9 D0 EA A5
.:FF48 B4 C9 06 D0 E2 20 22 F3
.
```

Because this function is important and probably will be used more than the others, it is worth detailed study. The first block of four Hex digits, 0340, is the machine address in which the first byte, A2 is stored and the next seven bytes on the row are stored in consecutive addresses with the last byte, F9, occupying address 0347. The second row is headed by the machine address, 0348, of the first byte, 36, and consequently the address of the last byte, 48, will be 034F. As many blocks of eight byte rows as desired can be displayed but remember that asking for 0340, FFF0 will spew out page after page of scrolling byte patterns because you are asking for all bytes between 0340 and FFF0!

The main use of the M function is that it enables a machine code program to be entered very easily. All we have to do is to expose a block of memory into which the program is to be housed and then simply use the cursor to change the existing bytes to those we want. After keying in a row of new bytes, pressing RETURN will automatically place these in memory, ie, they replace the previous contents.

DISPLAY REGISTER CONTENTS (Function "R"). Type after the prompt, .R

```
### COMMODORE BASIC ###
 31743 BYTES FREE

READY.
SYS1024

B*    PC   IRQ  SR AC XR YR SP
.;  0401 E62E 32 04 5E 00 F8
.
```

On pressing RETURN, the contents of the registers are displayed as previously described in the default situation after SYS 1024. This is very useful during debugging bouts because it tells you what was in, say the Accumulator, instead of what you thought was in it.

SAVE PROGRAM ON TAPE (Function "S"). Type after the prompt, .S "BLOGS", 01,XXXX,ZZZZ
This will save on cassette 1, a program called BLOGS, occupying a range of addresses XXXX to ZZZZ. On pressing RETURN the usual PRESS PLAY AND RECORD message will appear. A word of advice here; make a habit of SAVING your program on tape *before* you run it.

```
.S"BLOGS",01,0300,0400
PRESS PLAY & RECORD ON TAPE #1
OK

WRITING BLOGS
```

Why? . . . because, like the writer, you will have bugs in the program and it is possible (in fact highly probable) that the machine will crash causing a furious re-entering exercise accompanied by curses and obscenities. Remember that TIM has no patience with you and lacks the humanity of BASIC.

LOAD PROGRAM FROM TAPE (Function "L"). Type after the prompt, .L "BLOGS",01

```
.L"BLOGS",01
PRESS PLAY ON TAPE #1
OK

SEARCHING FOR BLOGS
```

This will load the program BLOGS from cassette 1 into a block of addresses. Note it is unnecessary to state the addresses because the original SAVE action automatically placed this information on the tape header.

RUN PROGRAM (Function "G"). Type after the prompt, .G XXXX.
This causes the execution of the program starting at the address XXXX. Thus if we type G 033A, the byte stored in address 033A will be the first code to be executed and the machine will carry on executing every succeeding byte until it reaches some kind of "stop" code. The character "G" of course stands for "GO" and is the equivalent of RUN in BASIC.

EXIT TO BASIC (Function "X"). Type after the prompt, .X.

```
B*    PC   IRQ  SR AC XR YR SP
.X  0401 E62E 32 04 5E 00 DC

READY.
```

This will allow an escape from TIM back to the shelter of BASIC as soon as RETURN is pressed. The familiar READY message appears again.

This table, remember, is in addition to and does not replace the Programming Manual. Another useful aid (before beginning to code) is an address map of the PET screen area giving the addresses of the first character in each line in both decimal and hexadecimal. This will save much tedious conversion exercises; for other machines check your documentation or see our Graphic Details series.

Understanding And Writing Code

Each line of a machine code program is called an INSTRUCTION and normally consists of two parts, the operation code (OP CODE) which tells the machine *what* particular action is required and the OPERAND which tells the machine *where* the data is which requires the action. An instruction therefore has this format:

OP CODE	OPERAND
85	6F

(both parts in Hex code).85 6F is an example of an instruction which will STORE the contents of the ACCUMULATOR in the address 6F. Don't worry if you can't see why at the moment. First of all, what is an ACCUMULATOR? A computer requires a general purpose storage cell capable of performing various arithmetic and other weird operations on its contents. The majority of the data stored in RAM and ROM must be passed to the accumulator in order to be processed in some way before being returned back. The majority of instruction in the machine code repertoire refer implicitly to the accumulator.

It is capable of holding eight bits (one byte) and is therefore the same "width" as the RAM and ROM memory. Its data content can be specified by two hexadecimal digits. The meaning attached to the bits is whatever the programmer wants them to mean. If the process is arithmetical in nature, then the programmer obviously intends the bits to represent a number. This number will be in the, so-called, "two's-complement" form which will be explained later. At other times, the bits might be an ASCII code for some particular character or perhaps a set of signals for an outside system.

In addition to the accumulator, the 6502 has two registers termed X and Y and which have their main use in "IN-

The PETs screen memory map.

DEXED" addressing (to be explained later) but can also serve as registers (but not capable of such sophisticated operations as the accumulator).

An important register used to indicate the current status of the machine is the "Processor Status Register". It is not a register in the usual sense of being a data storage device. Each bit is a "flag", signalling the processor in a "yes/no" fashion — such things as overflow, carry out, negative number etc. Its primary use is during BRANCH IF type operations.

The Stack-pointer is another special register used to point to an address in a bunch of memory addresses called the "STACK".

The PROGRAM COUNTER is the most important register in the machine. Its current contents is the address of the *next* instruction to be executed and it is the only register which is 16 bits wide (two bytes).

All the registers are included at the bottom of the Machine Code Table.

Examples: 4th Character position on line 17 has the address 8283 Hex;33411 Dec.
Middle of screen is line 13 + 19 = 81E0 + 13 Hex = 81F3 Hex = 33248 + 19 = 33267 Dec.
The APPLE and ITT 2020 Text Page is schematically the same but the addresses start at 0400 Hex (1024 Dec) instead of 8000 Hex.

At this point we'll take a breather. Our next foray into the world of machine code will deal with the various addressing modes that allow you to decide how and where you are going to store your information and programs.

THE NORTH'S LEADING NASOM SPECIALIST

NEW PRODUCTS FOR NASCOM:

DISCS:
Single drive £380.00
Double drive with CPM & EBASIC £640.00
Ask for details
Professionally designed for your NASCOM

KENILWORTH CASE
A high quality case made from stelvetite coated steel and solid mahogany £49.50
Mounting Kit for two cards T.B.A.
Mounting Kit for five cards £19.00

SARGON CHESS PACK
This pack includes the book and a tape with Sargon prepared to run under NAS-SYS. Also included is a special graphics rom and a PCB giving your NASCOM the ability to switch between two graphics ROMs, your original and the chess ROM. All the above for only £35.00

EPROM PROGRAMMER
This unit allows the NASCOM user to program both 2708 and 2716 EPROMs and complete with operating software only £25.95

INTERFACE EPROM BOARD
Provides sockets for both 2708 and 2716 EPROMs (up to 16 EPROMs) and also provides a fully decoded socket for the NASCOM 8K BASIC ROM. This board is produced to full NASBUS specification and can be used in "page mode" together with the new NASCOM RAM B. Wait states may be generated on board to allow a NASCOM 1 to run at 4MHz in BASIC. The complete Kit at only £55.00

CASTLE INTERFACE
Gives the following features :- Auto tape drive * Auto cassette muting * Auto serial printer muting * 2400/1200/300 BAUD cassette. This interface built and tested complete with documentation at only £17.50

ASTEC 10" B/W MONITOR
A Professional Cased 10 inch Monitor giving superb resolution, only £99.50

ANALOGUE TO DIGITAL CONVERTER
This unit gives 4 Channels with an Input Range of 0 to 120mV up to 0 to 24V. Conversion time (average) 0.5 mSec. Supplied built and tested at only £49.50

DUAL MONITOR
This Kit allows switching between two monitors on a NASCOM 1 e.g. T4 and NAS-SYS £6.50

PORT PROBE
A very useful device for testing and evaluating ports and peripheral software with improved documentation £17.50

HEX AND CONTROL KEY PADS
Our popular range of add on key boards for the NASCOM micros
HEX for NASCOM 2 £34.00
HEX & CONTROL KEYS for NASCOM 1 £40.50

CASSETTE MACHINE
Will reliably record data at 2400bd and above manufactured by SHARP £25.50

PROGRAMMERS AID
In 2 2708 EPROM gives the NASCOM ROM BASIC many extra commands: AUTO, RENU, DELE, DUMP, FIND HEX, APND, HELP etc £28.00

PROGRAMMABLE CHARACTER GENERATOR for NASCOM 2
Gives soft ware selection between standard graphics and high resolution graphics 8192 programmable dots £60.00

BITS & P.C.s GAMES TAPE 1
Good value - ten excellent games £8.00

PRINTERS
We have a good range of printers all of which will work on the NASCOM. RICHO, EPSON, IMP, QUME, ANADEX

BOOKS
Full range including INMC mags

MEDIA
Paper, diskettes, ribbons, leaderless cassettes, VDU tables, etc

MEMORIES
4116, 4027, 2708, 2716

BUILT SYSTEMS REPAIRS MAIL ORDER and ADVICE are our SPECIALITY

INNOVATIVE
TRS-80 SOFTWARE
FROM THE PROFESSIONALS

SUPERSCRIPT

SuperScript is a series of machine language programs which will permanently customise Tandy's Scripsit to a user's own requirements, particularly as to his printer. It also adds a number of enhancements to the original Scripsit program. The program includes a number of features which we do not have space to list here, but the three principal ones are that the user can now access the Disk Directory from within SuperScript, listing all files and the number of free granules on the diskette. Files can be killed from within SuperScript so as to make extra space to fit in a large text file. The third and perhaps the most important enhancement is to permit almost any printer to be used with Scripsit. It includes eight driver routines for both serial and parallel printers and these include utilities to enable the user to sculpture a customised serial or parallel driver to his own particular requirements. If your printer will backspace then underlining and slashed zeroes are options. Dedicated drivers in the package are for Diablo parallel and serial, NEC5330 parallel and serial and two general purpose drivers.

Disk for minimum single drive 32K machines **£19.50**

DUEL-N-DROIDS

A "second generation" Android Nim. Leo Christopherson has done it again! Two androids battle it out before your eyes with laser swords! There are two forms of play. In the first the player controls one android and the computer the other. The player must achieve a certain rank of skill as a swordsman to enable the android to go on to fight a tournament. The player's android is controlled by four keys and the higher the rank that the player can attain the better the chance that his android will beat the computer when it enters the tournament. Tournaments are of two types. In one, the player's android is pitted against an equally ranked android controlled by the computer. In the other the player's android fights against androids controlled by the computer of random ranking. Android Nim by Christopherson created something of a revolution in microcomputer games and Duel-N-Droids follows on in this same tradition. Excellent sound is provided in the program.

Tape version 16K TRS-80 or video genie .....**£9.50**, Disk version 32K one drive **£12.50**

BASKETBALL

Another highly graphically orientated machine language action game with sound. Each game lasts four minutes and either two players take part or one player plays the computer. The graphics are based on a three dimensional depiction of a basketball court on which there are two players. One is controlled by each human player if two are playing, or when a human player plays against the computer the home player is controlled by the computer. The appeal of the game is its realism. The court player may be controlled in one of four directions, may dribble and shoot for the basket. The player who scores the most baskets in the four minutes of play wins the game.

Tape version 16K TRS-80 or video genie .....**£9.50**, Disk version 32K one drive **£12.50**

QUAD

Quad is three dimensional noughts and crosses. As its name implies, it is played on a cube of four layers each with four ranks. Like noughts and crosses the aim of the game is to get crosses or noughts in a line either horizontally, vertically or diagonally. The cube is depicted graphically on the VDU and either two players may take part or a single player may play the computer. Four levels of difficulty are provided and a time clock is also included for each move. A particularly important feature of the game is that the cube on which the game is played may be rotated so that the player can see it from a different angle. A number of commands are provided including setting up previous positions, backing up to a previous position, progressing to the next position, reversal of order of play and switching of opponents. This is a complex game of strategy in which the player will need all of his skills.

Tape version 16K TRS-80 or video genie .....**£9.50**, Disk version 32K one drive **£12.50**

CODE BREAKER

Code Breaker is a logic game with sound effects. It is not necessary to describe this program in great detail because it is essentially a computer adaptation of the well known logic game Mastermind. The object of the game is to determine with as few moves as possible the colours and positions of four secret code pegs. For each move the colour and position of four pegs is chosen and the response of the computer is with a black, white or pink peg in respect of each position of the player's peg. These three colours have different meanings and from their positioning it is possible to logically deduce the position of the hidden pegs. The program features sound effects and a graphic layout of the code pegs.

Tape for 16K TRS-80 or video genie **£6.50**

All prices exclusive of VAT which should be added at the prevailing rate. Postage and packing including VAT **75p** regardless of the number of programs ordered.

Send large SAE (44p) for our current Catalogue of TRS-80 software. Add £1.85 for a binder.

COMPUTER GOLF

Leonard Keighley

A golf game simulation written in Standard BASIC suitable for use on almost any micro. It'll also save you a fortune in lost balls!

Golf — that game played by out-of-condition executives in search of the nineteenth hole. Does it summon up visions of people pushing a little white ball round a large area of waterlogged grass in the pouring rain? Because, if so, we have found an answer. A full eighteen-hole course with all the usual obstacles, but without the rain, and you can have all this in the comfort of your own, private nineteenth hole — your living room.

This implementation, which even allows you to program in your favourite course, is written in as near 'Standard BASIC' as possible and has been proved on a Honeywell mainframe.

Playing Equipment

You are provided with a bag of clubs containing three woods, a set of irons from number two to number nine and a second set of irons which may be used at less than full strength. When you reach the Green you will automatically be given a Putter. The clubs are coded in the following way.

Woods; 1 = Driver, 2 = Brassie,
3 = Spoon (full strength swing only)
Irons; 12 = Two iron, ... 19 = Nine iron (full swing only)
Irons; 22 = Two iron, ... 29 = Nine iron (partial swing)

When you use a partial swing iron you will be asked for the percentage strength that you require, this must be a number between 1 and 99. Your handicap must also be within the PGA rules limits of 0 to 30.

On reaching the green you will be asked for the potency of your putt, this must be a number greater than zero and the bigger the number the farther the ball will go. As a rough guide 0.2 is one foot.

Conversion Possibilities

Providing that your computer's version of BASIC can handle arrays you should have absolutely no trouble at all in implementing this game on your system. Indeed, anyone who has an Extended BASIC can probably enhance the program very considerably by using strings, ON . . GOTOs etc. Really ambitious types can even have a go at putting graphics into it.

Self Instruction Courses from Cambridge Learning

They're faster and more thorough than classroom learning: you pace yourself and answer questions on each new aspect as you go. This gives rare satisfaction — you know that you are learning and without mindless drudgery. With a good self-instruction course you become the world's best teacher.

MICROCOMPUTERS ARE COMING– RIDE THE WAVE! LEARN TO PROGRAM!

MILLIONS OF JOBS ARE THREATENED, BUT MILLIONS MORE WILL BE CREATED

LEARN BASIC

The language of the small computer and the most easy-to-learn computer language in widespread use. Teach yourself with a course which takes you from complete ignorance step-by-step to real proficiency with a unique style of graded hints. In 60 straightforward lessons you will learn the five essentials of programming: problem definition, flow-charting, coding the program, debugging, clear documentation. Harder problems are provided with a series of hints so you never sit glassy-eyed with your mind a blank. You soon learn to tackle really tough tasks such as programs for graphs, cost estimates, compound interest,and computer games.

COMPUTER PROGRAMMING IN BASIC (CPB) 4 Vols. £10.00

Book 1 Computers and what they do well; READ, DATA, PRINT, powers, brackets, variable names; LET; errors; coding simple programs.
Book 2 High-and low-level languages; flowcharting; functions; REM and documentation INPUT, IF....THEN, GO TO; limitations of computers, problem definition.
Book3 Compilers and interpreters; loops, FOR....NEXT, RESTORE; debugging; arrays; bubble sorting; TAB.
Book 4 Advanced BASIC; subroutines; string variables; files; complex programming; examples; glossary.

THE BASIC HANDBOOK (BHB) £11.50

This best-selling American title usefully supplements our BASIC course with an alphabetical guide to the many variations that occur in BASIC terminology. The dozens of BASIC 'dialects' in use today mean programmers often need to translate instructions so that they can be RUN on their system. The BASIC Handbook is clear, easy to use and should save hours of your time and computer time. A must for all users of BASIC throughout the world.

A.N.S. COBOL (ANS) £5.90

The indispensable guide to the world's No. 1 business language. After 25 hours with this course, one beginner took a consulting job, documenting oil company programs and did invaluable work from the first day. Need we say more?

Flow Charts and Algorithms

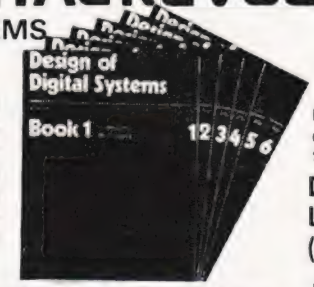
are the essential logical procedures used in all computer programming and mastering them is the key to success here, as well as being a priceless tool in all administrative areas - presenting safety regulations, government legislation, office procedures etc.

THE ALGORITHM WRITER'S GUIDE (AWG) £4.00

explains how to define questions, put them in the best order and draw the flow chart, with numerous examples.

JOIN THE DIGITAL REVOLUTION!

DESIGN OF DIGITAL SYSTEMS (DDS) 6 Vols. £13.50



Written for the student or enthusiast, this course is packed with information, diagrams, and questions designed to lead you step-by-step through number systems and Boolean algebra to memories, counters, and simple arithmetic circuits; and finally to an understanding of the design and operation of calculators and computers

BOOK 1 *Decimal,Octal,* hexadecimal, *and binary number systems and conversion between number systems;* negative numbers; complementary systems. **BOOK 2** *OR and AND functions; multiple-input gates, truth tables; De Morgan's Laws;* canonical forms, logic conventions; Karnaugh mapping; three-state and *wired logic.* **BOOK 3** *Half,* full, serial, and parallel *adders;* subtraction; processors and ALU's; multiplication and division. **BOOK 4** *flip flops; shift registers; asynchronous,* synchronous, *ring,* Johnson, and exclusive-OR feedback *counters; ROMS and RAMS.* **BOOK 5** Structure of calculators; keyboard encoding; decoding display-data; register systems; control unit; PROM; address de-coding. **BOOK 6** CPU; memory organisation; character representation; program storage, address modes; input/output systems; program interrupts; interrupt priorities; programming; assemblers; computers; executive programs; operating systems.

Digital calculators and watches came in during the 1970's. Soon you will see digital cash cards, telephones, car instruments, and TV messages from your friends.

DIGITAL COMPUTER LOGIC AND ELECTRONICS (DCL) 4 Vols. £7.50

A course covering the material in *italics* on the left, but at a slower pace. (4 vols)

GUARANTEE — No risk to you. If you are not completely satisfied your money will be refunded without question, on return of the books in good condition within 28 days. Our free booklist is sent with each order.

CAMBRIDGE LEARNING LTD. (Registered in England No. 1328762)

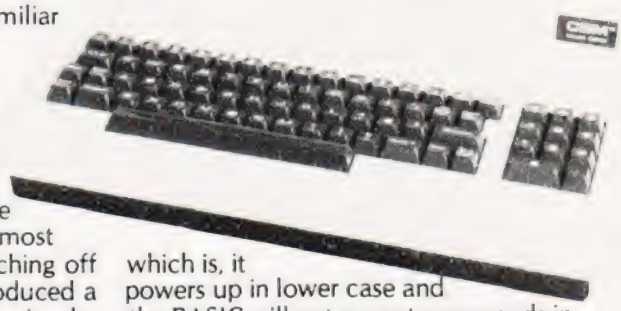
A P Stephenson

We take a close and detailed look at Commodore's bid for the small business market. Can a £3000 system really compete in this field? Read on and find out.



This system consists of a new microcomputer bearing the series number 8000, a new, dual-drive flopy disc unit providing over 1 Mb of non-volatile storage (8050), an intelligent tractor feed printer (3020) and supporting software. Although primarily aimed at the small businessman it should be equally valuable in science, education and even "home" situations. Commodore Business Machines are showing signs of embarrassment with their original choice of names. The hitherto famous and friendly word "PET" no longer appears on the front panel of their models. Perhaps they have made deeper inroads into the small business, workshop and educational fields than they originally estimated and now feel "PET" is a name lacking in prestige. It would appear they are fighting a battle because even their latest brainchild has been cheekily dubbed the "Super PET" by magazines, advertisers and trade journals.

The correct title of this machine is simply "MODEL 8032" which is a compound of the "8000" series and the internal RAM capacity of 32K. All this equipment was not mine unfortunately, it just happened that the Editor of CT gave me the opportunity of reviewing the system. In one respect it is nice to have the loan of such an expensive box of tricks for a while without having to pay considerable amounts of cash per day to hire it. Against this however, is the pain of parting with it because, contrary to the teachings of our famous bard, . . . parting is *not* such "sweet sorrow". In this case, parting will be downright painful because I must say immediately that, subject to some reservations, the system is impressive.

The Big Box

The first box opened was of course the SuperPET (sorry, the 8032). Superficially, the appearance is that of the rest of the traditional PET stable, a mixture of modernity and ancient Egyptian, the most obvious difference being the larger Sphinx-like head. After a preliminary examination for superficial damage, the machine was plugged in and the 230 volt AC fuel supply injected. Expecting to find after a few seconds that familiar little message concerning the number of bytes free, it was frightening to stare at a solitary exclamation mark bang in the middle of the screen. After a very short time, even *this* suddenly vanished and the screen took on an impassive, almost sullen air of nothingness. Switching off and on again several times produced a marginally improved response in the form of the machine code monitor display. Again this vanished after about five seconds to give way to a screen full of colons and asterisks. Resisting the desire to clout the wretch with a five pound hammer (which I keep specially for such occasions) I tried typing "X" which normally returns you to BASIC, but to no avail. It did, however, respond to "M XXXX,ZZZZ" which indicated that at least the machine code monitor appeared to be working and so it was considered a possible line of attack to view the contents of addresses C000 Hex onwards where the BASIC interpreter normally resides in the traditional models. Nothing but streams and streams of AA bytes!. Even to my impoverished mental equipment the symptoms would indicate a defective ROM (or ROMs). Opening up the innards displayed the row of ROM chips (socketed fortunately) on the right hand side of the board. After switching off the supply, the ROMs were gently eased up at one end and pushed back again (which often removes a dust or grease spot). The emergency operation finished, the abdominal cavity was then closed and life support reactivated. The patient responded immediatly by outputting the following text on the screen:

```
***commodore basic 4.0***
31743 bytes free
ready
```

The familiar flashing cursor completes the message which is all in lower case, exactly as shown.

Not being used to lower case, I pushed the shift-lock down and entered the line 100 A = 250 and then RUN. This produced a syntax error and confirms the first major difference in the Super PET which is, it powers up in lower case and the BASIC will not accept commands in upper case. For traditional PET owners, they may be relieved to know that 'POKE 59468,12' will still operate and allow coding to take place in upper case 'POKE 59468,14' will produce a reversion back to the new "norm".

With regard to the screen display, there are three major differences. There are now 80 characters on a line and the screen is 12" diagonally which gives an effective screen display of 9.5" by 7.5" approx. The characters are slimmer because there are twice as many characters on the line but the tube is *not* twice as big. The effect is good from an aesthetic viewpoint. The character font includes a row of blank dots (if you see what I mean) at the bottom, which provides neat separation between lines. This, I believe, is a truly major improvement. A complete page of text on traditional PETs could only effectively occupy 13 lines unless you were prepared to put up with atrocious overcrowding. If we bear this in mind, the SuperPET is not only 80 characters wide (double the usual) but a full, usable, 25 lines deep. So much for the screen, now the keyboard.

The keyboard layout is similar in most aspects to an ordinary office typewriter which is only to be expected in a machine primarily designed for business. The top row of keys are the numerics and are duplicated on a separate eleven-key pad to the right of the main board with the zero-key which is double width, (these keys have *no* alternative shifted characters). There are the usual cursor controls, a SHIFT key on either side and a SHIFT LOCK. A welcome addition is a REPEAT key which paints a stream of characters until released and operates on all characters

including the cursor controls and the space bar.

Another innovation is a key marked ESCAPE which literally allows you to escape from that infuriating condition which results from trying to move the cursor after a single quote has been typed. Previously, the only way way out was a RETURN and start again or punching a dummy closing quote. Typists will also appreciate the new TAB key which allows the pre-setting of column positions, particularly when entering data. It is worth mentioning that the CLEAR/HOME key has been repositioned only two keys away from the SHIFT. Since these two keys are frequently used in conjunction there is no longer the agony of strained tendons after a bout of keyboard bashing. The REVERSE/OFF key is still present in its original position, enabling characters to be printed in reverse highlights but the expected facility of slowing up the display during LIST with this key produced no effect. This function, found by trial and error, resides in the key marked ← which is extreme left hand, top row. Holding this down slows a LISTing down to two lines per second in both the shifted and unshifted positions. There is still no "RESET" facility and a system crash is still a surgical emergency, necessitating a short sharp shock to the Power switch. This is not a criticism because we must again bear in mind that the machine is primarily intended for business use. A RESET key can be highly dangerous when operating professional, non-crashable (?) software. The mechanincal feel of the keyboard is the same; very positive and a tiny bit "clangy" which to delicate 'Establishment' ears may be a trifle irksome. Personally, I like a bit of a clang . . . provides a tactile and aural indication that you still have enough energy to operate the keys! Finally, a nice little extra; a pleasant tinkle escapes from the machine (a piezo electric transducer) when the cursor reaches six characters from the edge of the screen.

The User's Guide

Before continuing with further details of the hardware it would be appropriate to mention the instruction manual which arrived with the machine. It is entitled "User's Guide" and presents a modern, glossy, professional appearance. Alas, study of the contents leads to the depressing conclusion that the cover is indeed the best part. From a purely literary viewpoint it is faultless . . . not a split infinitive or an incorrect tense anywhere. It is a most beautifully written piece of non-information and should arouse envy in most diplomatic circles of the Foreign Office. It is little more than a sales brochure and, remarkably, devotes most of its pages to the description of the floppy disc and the printer. The SuperPET itself is treated in a most perfunctory manner but does include an example "program" which includes the astoundingly complex lines,

```
1 print "Hello!"
2 print"I am your new CBM."
3 print" So long for now."
run
```

It is amazing that Commodore can produce such excellently designed products but continues to ignore the wave of criticism directed at their supporting documentation. But still, we must be thankful this time . . . they have at least improved the cover!

The Operating System

There have been two previous operating systems. The first which controlled the original 8K model with the small calculator-type keyboard was known as "Revision 2.0" and, later, by the somewhat disparaging title of "Old ROM" to distinguish it from the "New ROM" or "Revision 3.0". Both of them were *almost* software compatible except for annoying discrepencies in POKE numbers. The SuperPET has yet another version, the "Revision 4.0" which awaits a colloquial title . . . perhaps the "Super New ROM"?

There is a warning in the "User's Guide" regarding a change in some POKE numbers, but no hint whatsoever of the details of these changes. There are no details either of the pointer locations in pages zero, one and two so it must be left to the usual enterprising few to dig out the list from the Commodore boffins. Perhaps "The SuperPET Revealed" may soon be on the bookshelves of the high street microcomputer shops. I have written to Commodore for some of the more guarded secrets buried in the (Super)ROM. The BASIC interpreter is still Microsoft's (as far as I know) but enhanced by a group of commands relating to floppy disc transactions. SAVE and LOAD still relate to tape transfers, DSAVE and DLOAD are the corresponding commands relating to floppy disc transfers. Thus the command DSAVE"BLOGS",D1 will save the program named BLOGS on Drive No 1 of the dual drive unit. DLOAD"BLOGS",D0 will load the program BLOGS from drive No 0. This is an improvement as far as the operator is concerned since it is unnecessary to define the IEEE device number (8). The disc directory can be obtained (without destroying the existing program in RAM) by typing DIRECTORY or the short form DI.

The set of benchmark tests defined in Henry Budgett's article which appeared in a recent edition of CT were tried out. The timings for all tests showed there is no significant speed advantage in the SuperPET. The microprocessor is still the old and faithful 6502 and there are one or two other "old faithfuls" as well. We *still* get the message "out of data error" when the RETURN falls through READY although it is a change to see it in lower case. STEP 0.1 in a FOR/NEXT loop *still* outputs a stream of unrounded nines when it feels like it. By the way, there is no pi function key which is the cue to discuss the graphic facilities.

There is no hint from the keys that graphics exist at all but 'POKE 59468,12' reveals that a SHIFT spews out the familiar little lines and squiggles. The key/character match is the same as before except that the graphics normally

The keyboard layout is similar to the existing types but with some extra functions and no graphics ledgends.

available on the top row are confiscated (by the numerics). The graphics normally coexisting with the separate numeric keypad are also banished from the repertoire. Nevertheless, the popular graphics are still available even if there are two snags in using them. The characters are not engraved on the keys, to avoid trial and error guessing games you will have to use stick-on labels. Secondly, as a direct consequence of the inherent gap between text lines mentioned previously, vertical lines can no longer be joined up. Programs with such lines written for traditional PETs will appear as broken lines but still quite pleasant. Finally, the Machine-code Monitor (TIM) resides in its old home at SYS 1024 and appears to offer the same facilities.

Software Compatibility

Programs written in BASIC during the pre-Super era appear to operate successfully on the new machine . . . at least mine do. There are, however, a few irritations. Firstly, text displays only inhabit the left-hand half of the screen although some parts of a program may wander at times into the vacant half. To quote an example, a subroutine to print a border round the screen using POKE characters with 32768 would bend round too early and the second half appear reversed on the right half of the screen. This is nothing to do with change of POKE numbers (fortunately) and it is simply a consequence of the 80 character screen width, easily corrected by changing a constant. It would be fair to mention that my programs are fairly straightforward and are relatively free from operating system POKEs. I subscribe to the belief that an opeating system should be tolerated, defects as well. POKEing pointer locations to "improve" a system may give short term advantages but are a headache to modify and certainly kill off any pretence of portability. Perhaps the best test of compatibility was an ASSEMBLER program I wrote (in BASIC) which did use a few POKEs and a few more PEEKs. This ran perfectly, so it is safe to conclude that whatever changes there are in the Revision 4.0 ROM they are minor in character. It is advisable to add the line POKE 59468,12 to the top of previous programs to restore the upper case and graphic characters and to remember that some of them are missing in the new PET.

Hardware Details

Superficially, there are no staggering changes in the appearance of the insides. The single board holding the chips looks much the same as in previous models but this applies to most circuit boards in this "high-technology" age. Rows and rows of black rectangles with the occasional lonely resistor to break the monotony. The RAMs are the usual 16K by one and are socketed, they are the well tried 4116 species. The ROMs are on the rights, five in all, and socketed. Two spare ROM sockets are provided, both looking a little sad from being unemployed. Let's hope the Toolkit will give one of them something to do. I lacked the courage to remove my own and try it out in the spare position . . . probably would have worked, but in the absence of specific knowledge it could have damaged the SuperPET or, even worse, damaged my £47 Toolkit!

There are five 40 pin sockets which house the 6502 microprocessor and the various input/output chips. The keyboard, tube electronics and power supply lines are each separately socketed for easy maintenance. As with all PET versions, there is ample space for servicing under the bonnet.

The communications with the outside world are as before. An "unintelligent" parallel user port . . . very useful if you know how to make it tick. An intelligent general purpose standardised bus system known as the IEEE 488 on which up to fourteen peripheral devices can be "daisy-chained". Each of these can be individually controlled and, in some cases, can control the others. The floppy disc and printer plug straight into this bus. A tape recorder plug is also provided on the board itself although this will entail opening up the bonnet. A large edge connector is available at the side for expanding the memory.

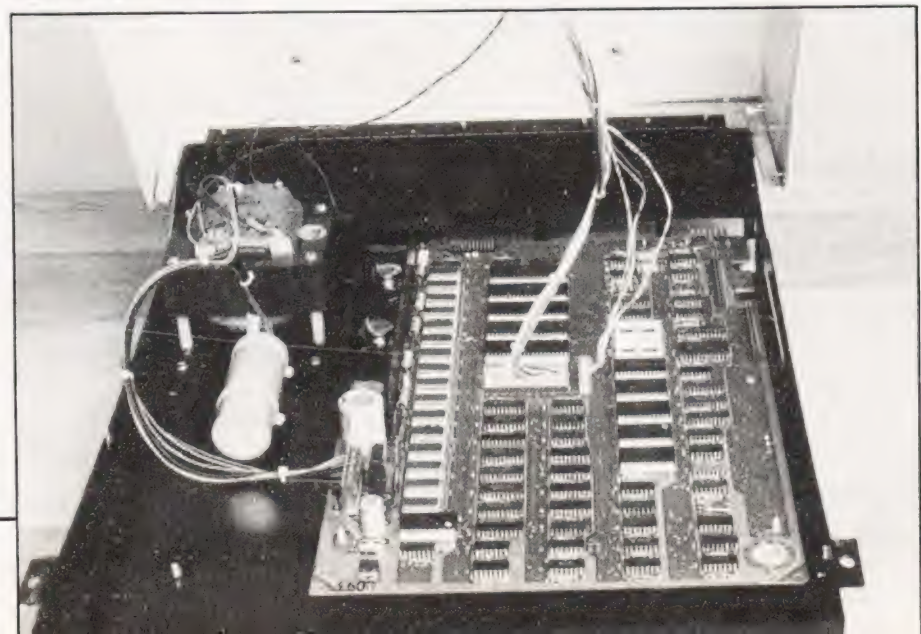
The upper compartment housing the screen and associated electronics is very nicely laid out and clean in appearance. Removal of two screws at the back enables the entire surround to be lifted off giving excellent accessibility. For those who wish to risk forfeiting their guarantee and are confirmed twiddlers, there are three horizontally mounted preset potentiometers beneath the tube and a little left of central. Looking from the back and reading from left to right they function as SYNC, VERTICAL LINEARITY and VERTICAL HEIGHT respectively. The width of the display can be adjusted by rotating a slug inside a coil which is wrapped around a plastic tube mounted vertically. It is located beneath and to the right of the tube connection socket. The picture is centred by rotating any one of two metal plates which surround the tube neck. It must be emphasised, however, that the above description of the adjustments has *not* been obtained from authoritative documents. They are the result of cautious twiddling and noting the effects. Remember that adjustments to presets should *NEVER* be carried out using an ordinary metal screwdriver . . . several thousand volts are lurking around and can take an agonising bite out of unprotected flesh!

Conclusions

An impressive machine in most respects with superb editing facilities. The introduction of the 80 column display is a major improvement and will probably become the norm for the coming generation of microcomputers. Modern accountants seem to want multiple columns for displaying the results of their cooking, with each column occupying several character positions plus decimal points and spaces.

Of all the factors which could influence the businessman (and indeed any other group of would-be purchasers) reliability outshadows them all. In this

The internal appearance of the 8032 is neatly ordered and board/component removal should not be difficult in the case of failure.



respect, the previous models of the PET family (except perhaps the very earliest) have been of proven quality. The teaching establishment where I am employed has been using a number of them for almost two years in the most appalling, anti-computer environment. Blackboard chalk, cigarette ash, coffee drippings, the untrained fingers of irreverent youth, the trained but equally lethal fingers of enraged teachers, should all combine towards hospitalisation of any box of delicate electronic equipment. But none of them have ever shown the slightest frown on their flat green faces. The new SuperPET is built on the same lines, in fact, apart from the increased screen width, the internal hardware is practically indistinguishable from its forebears. As far as the computer hobbyist is concerned, it must be a personal decision whether the financial loss of a trade-in is justified by the pleasure of gazing at an extra forty characters pre line. There may, of course be further sophistication which, because of the lack of information in the "User's Guide" I have been unable to comment upon in detail. Since beginning the writing of these notes, I have learned from CT that a separate manual on the programming details for this machine is available from Commodore but this is .... wait for it .... an OPTIONAL extra! (£10.00 Ed) Without being disrespectful to the firm, this is tantamount to buying a car, only to learn that the carburettor is an "optional extra". Nevertheless, I like the Super PET and wish I could afford to trade-in my present "microscreen" version for one. And yet ... perhaps I should wait another year or so in case a Super (Super) PET is launched with *truly* revolutionary improvements. The good old 6502 is, let's face it, beginning to show its age and like other micros of the first generation (even the "powerful" Z80) must eventually become a Senior Citizen of the silicon age.

The 8050 Dual Floppy Disc Unit

Although the computer has provisions for using a tape cassette as backing store it is not a practical device for business use. The 8050 has several advantages over the earlier 2040 and 3040 models. Each disc (or, more correctly, diskette) is the standard 5¼" diameter and can store a total of 533,248 bytes, so the total on-line capacity of both drives is, for all practical purposes, one million bytes (a byte equates to a character from a storage viewpoint). Businessmen who may not be familiar with computer jargon should be aware of applying simple arithmetic to these figures. For example, if we assume that one record (such as the typical inventory with items quantities, locating, re-order limits, cost and selling value etc) consumes say 200 bytes, arithmetic suggests that 5000 such records could be stored .... 1,0000,000/200. Unfortunately there are a considerable amount of overheads or "invisible exports" associated with disc storage and it would be wise to assume only half this number would be nearer to the mark. The actual percentage of "waste" depends mainly on the quality of the controlling software rather than deficiencies in the disc drives.

There are 77 tracks per disc with an average of 27 blocks per track, the outer tracks having a greater block density than the inner tracks in order to preserve a reasonably constant packing density when recording. A total of 224 files (program or data) can be individually named and displayed when the disc DIRECTORY is asked for. The number of blocks per file, the type of file and the total number of free blocks remaining on the disc always appears in the DIRECTORY display for the drive. The right-hand drive is called "drive 0" and the left "drive 1". A disc is simply pushed in the drive slot (after power has been applied) until it clicks. The immediate response is a gentle purr which lasts for about three seconds indicating that the disc is being INITIALISED. This is one of the improvements in the 8050 over previous versions ... initialisation of the disc is automatic on insertion instead of requiring a keyboard command string. The door mechanism has also been improved.

Removal of two screws allows the cover to be opened and hinged backwards. Apart from the two drives there are two circuit boards crammed with the usual chips. There are two microcomputers (6502 variety), one for the drive control functions and the other for the computer interface via the IEEE bus. Also fighting for recognition is a 6530 I/O chip with on-board RAM and ROM, two 6532s, etc etc. A total of 4K of RAM is shared by both controller and interface sections. This is an impressive armament of silicon intelligence and we should expect a correspondingly high system performance. The sophistication it offers is undeniable, it is not the easiest of systems to program but this seems to be a law of nature ... the inevitable trade off between ease of operation and versatility.

The new floppy drive appears to have conquered some of the earlier reliability problems.

Disc Reliability

The effects of overheating which sometimes plagued the 2040 and, to a lesser extent, the 3040 appear to be absent in the 8050. I have left it running many hours a day and, remarkably, have never had a read or write error except from the result of my own mistakes. However, the mains transformer and the fiery voltage regulators are positioned on the left hand side which, theoretically, should cause drive 1 to be the least reliable. The top ventilation holes are potentially dangerous for coffee drinkers; an overturned cup would stream straight down on to an unprotected circuit board directly beneath ... but of course no one would *dream* of resting a cup there!

Each drive has its own green light which turns on during motor activity and sometimes when the channel is open without the drive running ... I have not quite fathomed out the exact significance (needless to say, there is no hint in the "manual"). During data transfers, the middle light often flickers between red and green, which although not indicative of an error condition, is vaguely disturbing if (like me) you have a worrying nature. Great emphasis is made in the manual on the danger of switching the power on when a disc is in position but no mention of why! Is it because of a mains spike degrading the recorded data

or is it the more serious danger of damaging the drive mechanism? If the latter, then it is highly dangerous for the possibility to be allowed to arise . . . even the most careful of us can have a momentary lapse in attention. A microswitch could surely be incorporated to prevent power-on conditions should a disc inadvertantly be left in. All computer equipment should cater for both amateur and professional idiots. There is one other rather important point to watch when initially connecting up the 8050 and the printer to the IEEE bus. There are two IEEE interconnecting cables and it is worth emphasising that the 8050 *must* be the first one in the chain, ie, the cable which fits into the back of the PET must be the one which connects directly to the disc. I wonder why these cables cost £25 each? It would be boring at this point to go systematically through all the disc command syntax. The form of this syntax is, to put it as kindly as possible, long winded. Fortunately, for general purpose direct commands a disc unit arrives with a program called "TEST/DEMO" which, amongst other things, includes a program with the strange title of "UNIVERSAL WEDGE" although, surprisingly, when it is loaded it announces itself as "UNIVERSAL DOS SUPPORT". Once this program has been RUN, it hides itself out of the way of the working area until the machine is switched off. Direct disc commands are now refreshingly simple and make disc transfers easy enough for a child to operate. Another advantage of BASIC 4.0 is the ease of loading the *first* program on a disc in drive 0. Simply hold the SHIFT down and press RUN/STOP . . . no typed command is necessary. Thus if the UNIVERSAL WEDGE program is copied first on all discs (as a matter of habit) it can be used without effort. The symbol " > ' ' is now used to direct commands to the DOS SUPPORT. For example, the directory can be obtained by typing > $ 0 for drive 0 or > $ 1 for drive 1. The directory is placed in screen memory so it does not effect an existing program in RAM. With similar ease, RENAME, COPY, SCRATCH operations can be performed on disc files. Programs can be loaded and run by typing ↑ followed by the program name. There is, however, a restriction. DOS SUPPORT can only be used in the direct command mode and will not accept program lines. This means a reversion back to normal syntax.

There have been several DOS versions, each presumably offering improvements on the previous, but there may be a slight penalty to pay for them.

Commodore's tractor printer. Simple but effective for general use.

For example, discs previously formatted on the earlier 2040 model will not load when used on the 8050. This should be restated . . . I have not managed to do so up to now although it is quite possible that some way exists. It is not too serious a problem anyway, because tape copies of a disc on the 2020 can be saved on cassette and reloaded back onto the 8050 formatted disc.

The Commodore 3022 Printer

This is an established member of the Commodore range and, as such, cannot very well be "reviewed". It does however complete the trio of the business system hardware and merits some attention. The 3022 is an "intelligent" device and, like the disc unit, has an impressive array of ICs including its own microprocessor. The printing rate is about 70 lines per minute and like most impact printers is a shade on the noisy side although a silencing cover can be obtained. The printing head has a 6x7 character font which gives adequate resolution for all general office work except sales brochures. The feed is a tractor type and handles standard 8½" computer fanfold. The printer operates under the IEEE 488 protocol (jargon for 'plug it in to the existing daisy chain'). When using the OPEN file to printer, the device is No. 4. To print out a LISTing, use OPEN 1,4:CMD 1 : LIST. CMD causes the computer to treat the printer as the primary output device rather than the video display. As with the disc unit, the in-built sophistication adds a little to the programming task.

Software Packages

Software, to the business person, is more important than the hardware. Some will write their own programs tailored towards their specific needs, providing they have the time, energy, know-how and the right temperament. Most will have to rely on ready-made programs from one of the numerous "software houses". Most of the programs arrive as a disc plus supporting documentation describing the operating procedures. A bewildering array of programs are available covering the needs of most aspects of business and accounting and management. Many of them are good but some are absolute rubbish, hardly worth pushing into the drive slot. Cost and quality are not necessarily related. The trouble with many of the ready-made programs is their generality. However "general" purpose, there will inevitably be a certain area in which a particular business exhibits unique features and thus is not covered by the program. The criteria used to assess the worth of a program should include ease of operation. In fact this quality should over-ride most of the remaining virtues. However sophisticated the program, it will cease to be used if it has cumbersome operating procedures demanding the attention of a highly trained operator. Training costs time and, therefore, money which few small businessmen can afford.

A stack of professional software arrived with the equipment but the time limit imposed on its return prevented detailed examination of it all. In any case, some of it was specialised and my lack of expertise in the field of business management would not allow me to make judgements of any value. However, there was one particular program which, because of its complete generality, deserves to be included at the top of any list of software purchases. This program is called "OZZ. THE INFORMATION RETRIEVAL WIZARD".

The title lacks dignity and because of the Walt Disney associations would be likely to dissuade some buyers who may be cursed with a sober nature. Apart from the choice of title I thought the pro-

gram was magnificent and although I have not yet discovered the price, it will probably be worth every penny of it! (£400.00 including training Ed.) It was a delight to operate and the accompanying documentation was superb. Basically, it is a program for entering records of any description and retrieving any one of them in a second or so. The particular format of a record is first "drawn" by the operator (quite easy) and the resultant skeleton stored on disc. These formats can be of any form and could be provided quickly (a few minutes only) . . . this is a one-off job anyway. The following is a typical example of such a format:

```

A total of ten different named files are allowed per disc with each file holding perhaps several hundred records. The number of records per file and the number of files collectively determine the disc capacity . . . you can of course serialise files on different discs. All the usual record keeping facilities are available plus some powerful extras. Some idea of the repertoire can be gained by studying the following printout of the menu:

SHORT FORM	FUNCTION	PAGE

Above: Some typical displays produced by OZZ together with the 'MENU' of functions.

Left: The complete system ready to go.

Final Summary

The complete system consisting of the Super PET, 8050 floppy disc, the printer an OZZ *should* provide a powerful aid to any business venture and, subject to the choise of extra software, *should* pay for itself quickly. With regard to cost, there should still be some change out of £3000 even if extra sofware is required. There are other systems of equal merit and value on the market but it is probable that within this kind of price bracket, there are not many of them which can boast such a range of software from so many sources and on such diverse subjects.

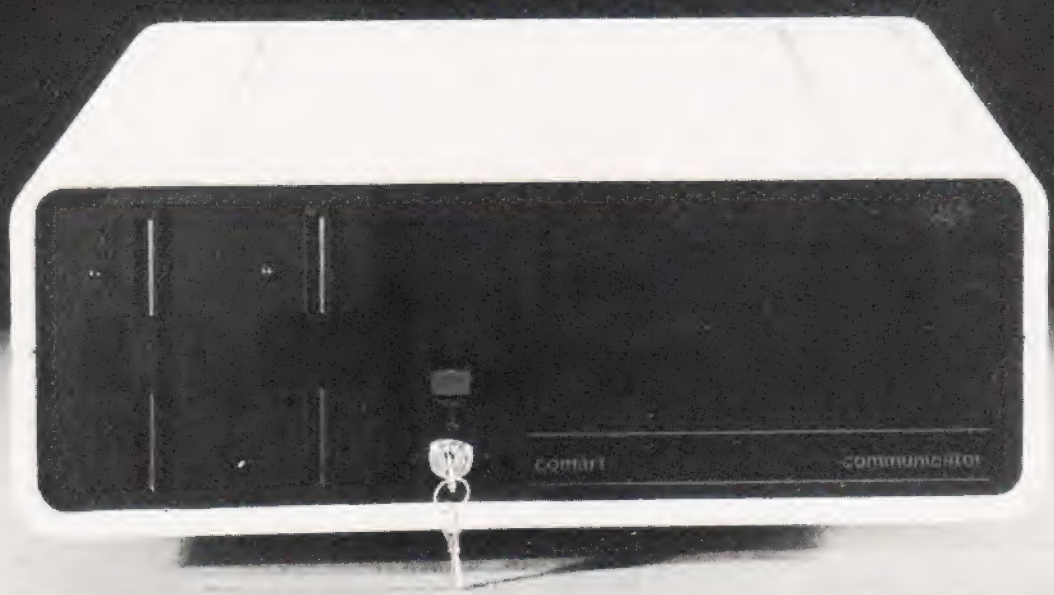
comart communicator

The clean simplicity outside...



...conceals the pedigree inside.

Comart'sCP100 Communicator is the new British designed, British made Microcomputer from Comart. It is the result of a carefully conceived development programme. It exploits Comart's first hand experience of the British computer market, and their growing strength as a manufacturer.

CP100 is the first of a new generation of flexible, expandable micros specifically developed to suit British operating conditions and communication requirements.

The clean lines outside, conceal the power within; its S-100 bus means wide ranging peripheral support, and simple after sales care. And, that's not all. Communicator is built to keep your future options open. It's ready for Prestel, asynchronous, and synchronous operation. It has expandable memory capability and yet it's price competitive as a stand-alone system with its CP/M™ operating system, and support software.

Find out more about Communicator today.

CATCH

I Soutar

Avoid being trapped by your ZX80

The object of the game is to avoid getting trapped by the computer. You move by inputting '5' to move left, '6' to move down, '7' to move up or '8' to move right (in the directions indicated by the arrow above those numbers). When you have moved, the computer will place a black square on one of the four sides of your position. If you move onto a black square the game ends and the computer tells you how many moves you managed to stay free for (about 100 is quite good).

NASCOM TITLES

A C Ellis

Preserve yours with this simple routine

It was recently brought to my attention by a fellow NASCOM owner that if you wish to keep your program title on the screen, then any use of the CLS (CLear Screen) command will remove it. The two obvious ways around the problem are to write a subroutine that puts the title back or to use the screen in scrolling mode so that the top line remains in place

An alternative method is to use this simple machine code routine, actually a modification of part of the NAS-SYS monitor. The routine is called from BASIC by a USR and effectively re-joins the monitor at the end of its CLS function. The routine is written into RAM from location 0C80H and is not affected by a BASIC cold start. The starting address for the USR is transferred by the single BASIC statement DOKE 14100, 3200. For those unfamiliar with NASCOM, omission of this command will result in the dreaded FC error. As a check to this you should find that the command has loaded addresses 1004 and 1005 with 80H and 0CH respectively.

Using the 6522 PIO to generate regular interrupts proves a quick and efficient way to produce a real-time clock display.

The following program allows you to run a real-time clock on your MICRON, or Microtan 65 if you have Tanex. It is written for a system configured with the minimal 2K of RAM installed on Tanex but can easily be relocated to suit the amount of memory you have. The functions of the computer can be used almost as normal without disrupting the clock display which is produced in the top left-hand corner of the VDU.

The only keyboard functions which will affect the clock are RESET, LOAD, SAVE or the use of the XBUG translator or assembler. These small sacrifices are not *that* drastic as the clock would normally be used as a reference in a program and initialised from this.

Implementation

The software makes use of the timer built into the 6522 I/0 device of the Tanex. This timer can be programmed to give continuous, regular interrupts which can be serviced by a short machine code routine and used to update the clock display.

A minor problem is that the keyboard is itself interrupt driven and a check must be made to establish what caused the interrupt. Fortunately the 6522 has an interrupt flag register which can be polled to establish which device caused the interrupt.

It is important to note that the first actions taken by any interrupt service routine is to save the curent values of the accumulator and the two index registers, just as its last action is to restore them. This prevents any apparent change in the main program although a slight decrease in speed might be noticeable. The processor's status word is automatically saved by the CPU on detecting an interrupt.

The Software

The main program, when called by the timer, increments the memory location 'A' and then checks to see if the total is 50. The time interval between interrupts is set at 20 mS so there are 50 interrupts per second. When 'A' has reached 50 it is cleared and location 'B', the seconds counter, is incremented. The process continues which minutes, 'C', and hours, 'D'. The final program segment places the clock on the screen and updates it at every interrupt, faster than the eye can see, so there should be no visible 'flicker'.

The short set-up program initialises the 6522 to operate its timer in the continuous interrupt mode and sets the interrupt vectors to point to the start of the main program (0B00). The timer is then loaded with the interrupt interval value and started by writing to its 'high' byte.

When using the BASIC the initial 'MEMORY SIZE?' query should be answered with 2816, given that you have only 2K of RAM and haven't re-located the program. It is important to note that the clock uses BCD so when initialising its time under BASIC you must also use this form. For example the time 12:25:15 would appear as 18:37:21 when coded by the program.

Program Re-location

The machine code set-up routine is directly re-locatable so no code changes are needed unless the main program has been moved. If the main program is re-located then the two interrupt vectors will need to be changed to suit the new starting address, the high byte goes in 0006 and the low byte goes in 0005. When BASIC is in use you must obviously restrict the memory so as not to overwrite the program. To set up in BASIC use the program lines given below as the start of your own program, SS = Seconds, MM = Minutes and HH = Hours. The machine code set-up routine should have the last two lines omitted if it is intended to be used as part of another problem because they return the computer to TANBUG.

COMPUTECH for apple
COMPUTECH for ITT

Well proven software for business applications on the ITT 2020 and Apple microcomputers.

Prices excluding V.A.T. for cash with order, F.O.B. London NW3

PAYROLL	(300+ Employees, 100 Departments, hourly, weekly, monthly. Very powerful but easy to use).	£375
SALES LEDGER	(500+ Accounts, 100 Departments).	£295
PURCHASES LEDGER	(500+ Accounts, 100 Departments).	£295
GENERAL (OR NOMINAL) LEDGER	(1000 Accounts, 100 Analyses, multi-purpose package). Job costing etc.	£295
UTILITIES DISK 1	(Diskette patch, slot to slot copy, zap etc).	£20
APPLEWRITER	(Word Processing, see below for U/L case).	£42
VISICALC	(Financial Modelling, Costing, Analysis).	£95
CAI	(Converts Apple pictures for ITT display).	£10

Over 500 packages in use, fully supported by us.

AND NOW HARDWARE!

LOWER & UPPER CASE CHARACTER GENERATOR £50

Replaces character generator to display upper and lower case characters on screen, includes patches to work with Applewriter, supplies the missing link! Specify Apple or ITT.

COMPUTECH DIPLOMAT H/S SERIAL INTERFACE £80

This card has been designed and built to the same professional standards that have resulted in the success of our software. The DIPLOMAT observes the proper "handshaking" protocol so that you can drive fast printers and send and receive date from other peripherals at high speeds without loss of data. Switch (& software) selectable baud rates to 19200 and many other options. Plug compatible with 'terminal' or 'modem' wired peripherals. Guaranteed.

MICROLINE M80 PRINTER £425

This neat, reliable machine prints at 10 characters per inch, 80 characters on an 8 inch line, or 40 expanded characters, or 132 very readable characters, upper and lower case and graphics, 9 x 7 dot matrix, 6 or 8 lines per inch. Parallel interface is standard, serial optional. Both friction and sprocket feed are standard, tractor optional. We can also supply the parallel interface card for Apple System computers for £80 and a driver to enable both text and graphics to be used. Optional custom colour matching for Apple or ITT. Optional character sets. *Trade supplied at very generous discounts for modest quantities.*

THE FABULOUS MICROMUX 8000 from £800

This is a brand new product, an asynchronous serial multiplexor with up to 16 ports, any one of which may communicate with any other independently, like a 'telephone exchange' for data! Built in test function. Firmware may be customised for special applications. Available in multiples of 4 ports up to 16.

Getting the best out of NASCOMs BASIC can be helped by understanding how the computer stores the programs.

This article is intended to give NASCOM owners some insight into how their version of the BASIC Interpreter stores programs. Some programs, both in machine code and BASIC, are given to illustrate the points and a games program is also given that uses a number of the techniques.

Interpretations

As each line of the program is entered the Interpreter searches for keywords, commands such as FOR, THEN etc., and replaces them with a single byte code or 'token'. For example END becomes 80H, GOTO becomes 88H etc. The actual code used depends upon the position of the keyword in a look-up table that is stored in the BASIC ROM from E143H onwards, END is the first entry and MID$ the last. Within this table the keywords are stored in ASCII coded form. However, the first character of the keyword has its most significant bit set allowing the start of each keyword to be easily identified. As an example of this the normal ASCII code for END would be 45 4E 44 but it is actually stored as C5 4E 44. This single byte replacement obviously shortens the program and saves on memory space. When the program is LISTed the full representation of the command is recovered from the look-up table.

Having replaced the keywords, the program line is moved from a temporary storage area, 1061H upwards, to the main program storage area. This starts at location 10F9H and when BASIC is entered through a conventional J command three null bytes (00 00 00) are entered from 10F9H. These indicate the end of the program storage area and are moved up through memory as the program is keyed in.

Each line of the program is preceded by a five byte header. The first byte is a null to mark the boundary between lines, the second and third form a pointer to the start of the *next* line and the final pair are the Hex form of the decimal line number. The following short program is shown as it is stored in RAM.

```
10  A=5
20  B=8
30  PRINT A,B
```

Location	Contents	Meaning
10F9	00	Header
10FA	02	Pointer to next line
10FB	11	
10FC	0A	Line number
10FD	00	(10 in Hex)
10FE	41	A
10FF	B4	=
1100	35	5
1101	00	Newline
1102	0A	Pointer to next line
1103	11	
1104	14	Line number
1105	00	(20 in Hex)
1106	42	B
1107	B4	=
1108	38	8
1109	00	Newline
110A	13	Pointer to next line
110B	11	
110C	1E	Line number
110D	00	(30 in Hex)
110E	9E	PRINT
110F	41	A
1110	2C	
1111	42	B
1112	00	Newline
1113	00	End of program marker
1114	00	

How the short BASIC program is stored in RAM.

Pointing The Way

The pointer given by the 'end of program' marker is 00 00 so when the program is being LISTed, for example, the Interpreter knows that it has found the end. An interesting experiment is to enter the above program and then type, in direct mode, the statement DOKE 3271,4346. Now try to LIST the program and see what happens. What you've done is to set the program pointer to its own beginning by loading locations 1113H and 1114H with address 10FAH. When you escape from the LIST type NEW or DOKE 4371,0 to restore sense.

When you type NEW, or CLOAD, the only effect on the stored program is that the contents of 10FAH and 10FBH are set to 00 so that the end of program marker is at the start of the program storage area. This suggests that there might be a way of restoring 'lost' programs if one could discover the first pointer value. Unfortunately it is not as simple as that because the Interpreter keep its own pointers to the program and data storage tables that follow during a RUN. If we can discover and restore these we can recover a 'lost' program.

This machine code program searches for the first 'end-of-line' marker and then enters the correct value at 10FA. It then continues through the program until it finds the end marker and places the correct pointers for these into BASIC's own workspace. If you are an habitual typer of CLOAD when you really meant CSAVE then this is a vital program to have in your library, it will only work after a NEW or CLOAD and will *not* restore programs after an inadvertent J command. The program can be stored anywhere in 'free' RAM, eg 0C80H and tested by keying it in, going to BASIC and writing a short program followed by NEW. Reset the machine and type E 0C80, you should find that you can now LIST the program.

```

Cheap and cheerful renumbering program for BASIC. It takes advantage of the way line numbers are stored by BASIC.

Simple Renumber

The following short program utilises the fact that the line numbers can easily be found in the header. It is a BASIC renumber program. It will only renumber the lines, it makes no attempt to sort out GOTOs and GOSUBs, from 10 in steps of 10. You can locate it anywhere in free RAM, possibly following the above example.

To run the program leave BASIC by a reset or MONITOR command and execute from the start of the machine code program. The value of XX XX must be any location 'safe' to use as a temporary store. Control is returned to BASIC and a LIST will reveal the new numbering. If you wish to alter the step value then change the value stored in DE but bear in mind that there are no safeguards against overflow.

Both programs can be called and loaded from BASIC. The following program will load both of the previous machine code programs and set the BASIC program pointer to 1004H. To test the renumber routine enter the program and RUN it. Now type M=USR(40) and then LIST. You should find that it has renumbered itself. The step value is the 10 in line 32. You can check that the restore function is working by typing NEW, LIST should give you nothing, and then entering the direct command DOKE 4312,16000:DOKE 4314,16000: M=USR(0). Typing LIST should now reveal the program.

Machine Code Subroutines

We can use the NASCOM's powerful Z80 CPU to provide machine code subroutines that speed up BASIC programs. It is quite possible to have more than one such subroutine within a BASIC program, indeed the Roadrace game uses them extensively.

Provided that you load the starting address of your subroutine into location 1004H the routine can be called by the BASIC command USR, eg 150 X=USR(0). The whole of this line is simply saying to the computer 'call the routine whose address is stored at 1004H'. Both the X and the number in the bracket are dummy variables, they don't mean anything, but they *can* be used if you want. The X can bring a value back from the machine code subroutine provided the number was placed in the AB register pair as a signed 16 bit binary number. The NASCOM keyboard scan uses this technique.

The number contained in brackets can provide a very efficient method of selecting one of many machine code routines. The normal method of selection is to change the value that is stored in 4100D (1004H) with a DOKE statement before calling the USR. This method requires two BASIC statements each time you change the routine, but there is a better way. To do this you need to set up a decoder routine pointing at 4100D which can use the number contained in the brackets. The value of this number is loaded into the DE register pair by a subroutine within BASIC itself, located from E98BH. If we load the decoder routine at 0C80H then we must remember to set the location in BASIC by a DOKE 4100,3200.

```
10 FOR J=3200 TO 3206 STEP 2
11 READ A:DOKE J,A:NEXT
12 DATA -29747,8681,3216,-5863
13 REM**THIS SETS DECODER ROUTINE
   AT 0C80H
20 FOR J=3216 TO 3248 STEP 2
21 READ A:DOKE J,A:NEXT
22 DATA -735,8976,-18562,-1248,8739,
   4346
23 DATA 9054,-17834,8427,-5127,8739,
   4310
24 DATA -10206,8720,4314,-3551,-5648
25 REM**THIS SETS UP 'FINDER'
   PROGRAM AT 0C90H
30 FOR J=3256 TO 3290 STEP 2
31 READ A:DOKE J,A:NEXT
32 DATA 33,4352,10,8665,4346,9054
33 DATA -4778,-30637,-20724,-13638,
   -3854
34 DATA 6617,-9755,9169,9075,10866,
   3208,-6632
35 REM**THIS SETS UP RENUMBER
40 DOKE 4100,3200:REM**SET BASIC
   POINTER
```

A BASIC program containing both the 'Finder' and the 'Renumber' routines.

```
0C80    CD 8B E9    CALL E98BH
0C83    21 90 0C    LD HL 0C90H
0C86    19          ADD HL DE
0C87    E9          JP (HL)
```

Multiple machine code routines from BASIC with this decoder.

The routine works by using the number to give the number of bytes after 0C90 that the required routine starts. Thus to call the keyboard scan at 0C90 we would use the statement M=USR(0) which would return 00 00, thus still pointing to 0C90 for the jump instruction. A routine that started at 0CB0 would be accessed by M=USR(32), 0CB0 being 32D bytes after 0C90.

Why have so many machine code routines you may ask? Well, it's far more efficient to handle tasks like printing to the screen in machine code than in BASIC, you may notice that in the Roadrace program there are no PRINTs apart from the text and comments.

All the various routines must end with a controlled return to BASIC, the following four bytes do this;

```
21 F2 F0    LD HL F0F2
E9          JP (HL)
```

Typical advantages gained by using machine code can be seen by looking at the routines at 0C80H, 0C90H, 0CA0H, 0CC0H, 0CE0H and 0D00H.

Remember that when you load the program you should omit all the REMs and check the data very carefully or you might do unpleasant things to your memory!

Trade enquiries welcome.

ARE YOU INTERESTED IN ELECTRONICS?

THEN YOU SHOULD KNOW ABOUT VERO.

We manufacture a wide range of products for the electronics industry and can make available to you a selection suitable for project work. We offer you a large choice of Veroboard and circuit board accessories, including the latest solderless breadboard — VEROBLOC, which enables you to use those valuable components time and time again. Use a piece of Veroboard to save a successfully completed circuit and choose a box or instrument case from our vast range to give your project that professional touch.

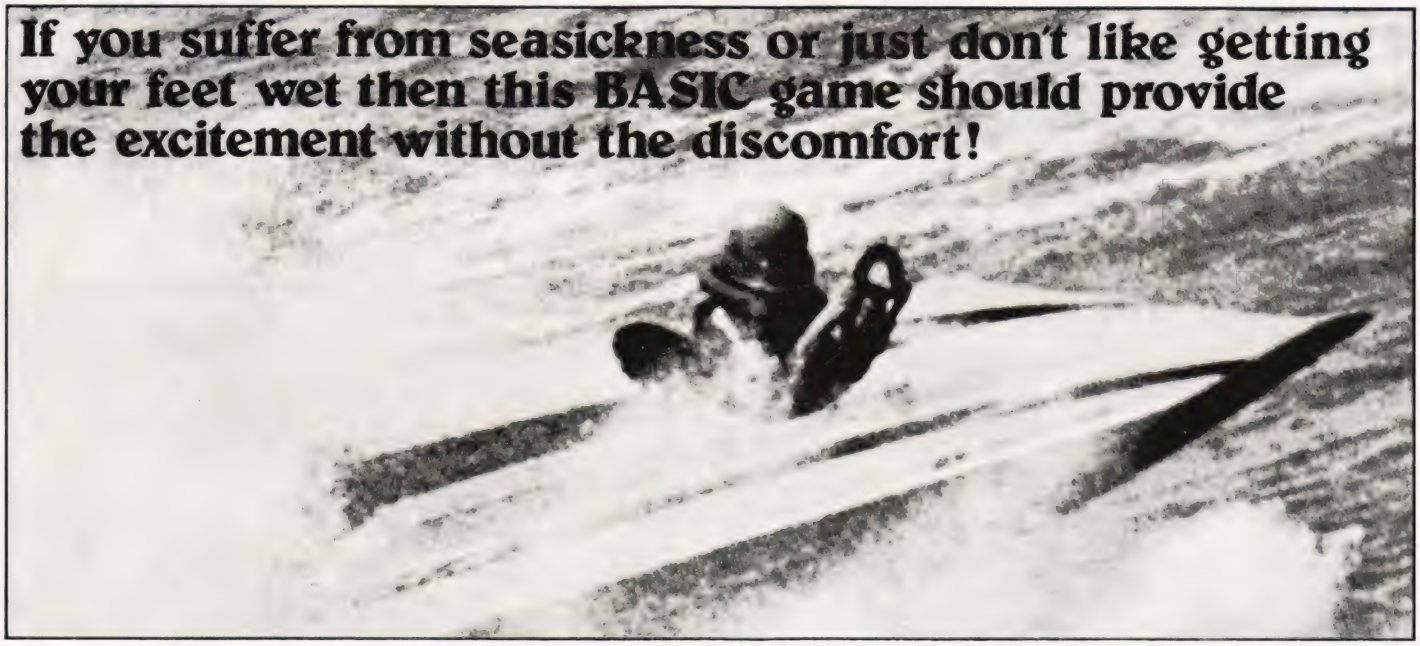
Andrew Thomas & Gareth Callister

If you suffer from seasickness or just don't like getting your feet wet then this BASIC game should provide the excitement without the discomfort!



OK 'HANDS UP' how many of you are dry-land sailors, or have trouble with navigational aids? If you are one, then here is the ideal program for you, it saves you from getting your feet wet — or *does it?*

You are in complete (?) control of an extremely powerful, fast power boat; in a race against other top power boat champions. The course and weather conditions vary on each game, though the weather conditions will not alter during the game. The course is marked out with buoys which will give you the direction and the maximum speed for that particular section (there are 20 sections in all). The direction is given in the form of the radius of the necessary turning circle (the program assumes that you are intelligent enough to know which way to turn).

To make the turn you must enter in the amount of RUDDER you need. Too much and you will cut the corner, too little and you will overshoot the corner though 'slightly' cutting the corner will help you gain distance and position. Both of the above will gain you immediate disqualification, just to hinder you. The lower the number entered for the rudder the smaller the turning circle and hence the smaller the radius. There is, however, one special case — '0' which will cause your boat to go straight. This has suprisingly been done to make the navigation easier, but be warned! The ratio between the rudder and the radius varies from 1 to 10 when stationary, to 1 to 5 at top speed just to make the game a *little* more difficult. To complete the course you must also regulate your speed to a value near to or, preferably, slightly above the maximum speed for the section.

The power to the drive is *not* the speed, but the amount of power you supply to the drive. The more power you supply to the drive the faster the boat will go. If you put too much power in, you run the risk of converting your boat into an aeroplane and flipping over. Life jackets are compulsory whilst using this program, in case you get a bit too excited!

The program is written in a standard PET Microsoft BASIC and should present no real difficulty in converting to other machines. Note that PRINT CHR$(147) is a Clear Screen command and line 190 can be replaced with 190 INPUT A$.

For those of you who wish to alter the game the following list of variables may help.

- C is the difference between actual and rated turning circles.
- D is the distance to the leader.
- E is the previous 'power to the main drive'
- E1 is the present 'power to the main drive'.
- F is the amount of fuel remaining.
- M is the maximum speed for the section.
- P is your position.
- R is the rated turning circle.
- S is your present speed.
- T is the rudder position.
- W is the prevailing weather condition.
- X is the section number.

SYSTEM 4000 EPROM EMULATOR/ PROGRAMMERS

P4000 PRODUCTION EPROM PROGRAMMER

This unit provides simple, reliable programming of up to 8 EPROMS. It has been designed for ease of operator use — a single 'program' key starts the blank check-program-verify sequence. Independent blank check & verify controls are provided along with mode, pass/fail indicator for each copy socket and a sounder to signal a correct key command & the end of a programming run. Any of the 2704/2708/2716 (3 rail) & 2508/2758/2516/2716/2532/2732 EPROMS may be selected without hardware or personality card changes.

2 year warranty **PRICE £545** + VAT

VM10 VIDEO MONITOR

This compact, lightweight video monitor gives a clean crip picture on its 10" screen. Suitable for use with the EP4000, Softy & other systems. **12 month warranty Price £88** + VAT, carriage paid

EP4000 EPROM EMULATOR/ PROGRAMMER

The microprocessor based EP4000 has been designed as a flexible, low cost, high quality unit for emulating & programming all the popular NMOS EPROMS without the need for personality cards, modules or hardware changes. Its software intensive design permits selection of the 2704/2708/2716/ triple rail EPROMS & the 2508/2758/2516/2716/2532/2732 single rail EPROMS for both the programming & emulating modes.

The video output (TV or monitor) for memory map display in addition to the built in Hex LED display, for stand alone use, is unique in this type of system. This, with the double function 28 Ken Keypad, powerful editing features, powered down programming socket, buffered tri-state simulator cable & 4K x8 data RAM gives you the most comprehensive, flexible & compact systems available today.

2 year warranty **Price £545** + VAT

MODEL 14 EPROM ERASERS

MODEL UV140 EPROM ERASER

Similar to model UV141 but without timer. Low price at **£61.50** + VAT, postage paid

MODEL UV141 EPROM ERASER

EX-STOCK

- 14 EPROM capacity
- Fast erase time
- Built-in 5-50 minute timer
- Safety interlocked to prevent eye & skin damage
- Convenient slide-tray loading of devices
- Available ex-stock at **£78** + VAT, postage paid
- Add £6 to order total for next day delivery by DATAPOST

SOFTY SYSTEM

EX-STOCK

Low cost card 2704/2708 emulator/programmer features —

● Direct output to TV ● High speed cassette interface ● On card EPROM programmer ● Multifunction keypad ● 1K monitor in 2708 ● 1K RAM ● 128 byte scratchpad RAM ● 22 in/out ports ● Access at card edge to all buses ● 1K EPROM emulation ● Direct memory access for fast data transfers ● Editing facilities including — data entry/deletion, block shift, block store, match byte, displacement calculation. ● Supplied with Zif socket, simulator cable & comprehensive manual.

Softy Kit of Parts	**£100** + VAT
Softy Built & Tested	**£120** + VAT
Softy Built power supply	**£20** + VAT

Postage & Packing is included in all prices

Add £6 to order total for next day delivery by DATAPOST

EX-STOCK

SOFTY CONVERSION CARD

Enables Softy to program the single rail EPROMS, 2508, 2758, 2516, 2532. Selection of device type & 1K block are by PCB slide switches. Programming socket is zero insertion force. Easy connection to Softy with the DIP Jumper supplied.

Built & Tested **£40** + VAT, postage paid

SOFTY PRINTER

EX-STOCK

- 40 column electrosensitive printer
- 5x7 dot matrix ● 2 print sizes
- Push button hex print-out of Softy's RAM, EPROM or intercursor contents
- On card PSU ● Selection of bytes per line

Built & tested **£145** + VAT, postage paid

How to order: Make cheques payable to Computing Today Book Service. Payment in sterling only please. Orders should be sent to: Computing Today Book Service, Modmags Sales Office, 145 Charing Cross Road, London WC2H 0EE. All prices include P&P. Prices may be subject to change without notice.

What Is A Microprocessor? £10.00
2 Cassette tapes plus a 72 page book deal with many aspects of microprocessors including Binary and Hexadecimal counting, Programming etc.

Adams, C.— BEGINNERS GUIDE TO COMPUTERS AND MICROPROCESSORS WITH PROJECTS £6.05
Understanding, building, programming and operating your own microcomputer.

Ahl — BASIC COMPUTER GAMES £6.60

Albrecht, B.— BASIC FOR HOME COMPUTERS. A self teaching guide £6.60
Shows you how to read, write and understand basic programming language used in the new personal size microcomputers.

Albrecht, B.— BASIC. A self teaching guide (2nd edition) £7.15

Alcock, D.— ILLUSTRATING BASIC £4.25
This book presents a popular and widely available language called BASIC, and explains how to write simple programs.

Adams.— MASTER GUIDE TO ELECTRONIC CIRCUITS £9.25

Hallmark.— MASTER IC COOKBOOK £7.45

Towers.— INTERNATIONAL MICROPROCESSOR SELECTOR £7.45

Barden, W.— Z-80 MICROCOMPUTER HANDBOOK £7.75

Barden, W.— HOW TO BUY AND USE MINICOMPUTERS AND MICROCOMPUTERS £7.90
Discusses these smaller computers and shows how they can be used in a variety of practical and recreational tasks in the home or business.

Barden, W.— HOW TO PROGRAM MICROCOMPUTERS £7.25
This book explains assembly language programming of microcomputers based on the Intel 8080, Motorola MC6800 and MOS Technology MCS6502 microprocessor.

Bibbero, R.J.— MICROPROCESSORS IN INSTRUMENTS AND CONTROL £13.10
Introduces the background elements, paying particular regard to the dynamics and computational instrumentation required to accomplish real-time data processing tasks.

Lancaster, D.— TV TYPEWRITER COOKBOOK £7.75
An in-depth coverage of TV typewriters (TVTs) the only truly low-cost microcomputer and small display interface.

Lancaster, D.— CHEAP VIDEO COOKBOOK £6.50

Lesea, A.— MICROPROCESSOR INTERFACING TECHNIQUES £11.20

Leventhal— INTRO TO MICROPROCESSORS £11.00

Lewis, T.G.— MIND APPLIANCE HOME COMPUTER APPLICATIONS £5.25

Hilburn, J.L.— MICROCOMPUTERS, MICROPROCESSORS, HARDWARE, SOFTWARE AND APPLICATIONS £17.40
Complete and practical introduction to the design, programming operation, uses and maintenance of modern microprocessors, their integrated circuits and other components.

Klingman, E.— MICROPROCESSOR SYSTEMS DESIGN £17.65
Outstanding for its information on real microprocessors, this text is both an introduction and a detailed information source treating over a dozen processors, including new third generation devices. No prior knowledge of microprocessors or microelectronics is required for the reader.

Kemeny, J.G.— BASIC PROGRAMMING £8.20
A basic text.

Korn, G.A.— MICROPROCESSOR AND SMALL DIGITAL COMPUTER SYSTEMS FOR ENGINEERS AND SCIENTISTS £23.80
This book covers the types, languages, design software and applications of microprocessors.

Tedeshi— THE ACTIVE FILTER HANDBOOK £5.60

Rao, G.U.— MICROPROCESSOR AND MICROPROCESSOR SYSTEMS £23.00
A completely up-to-date report on the state-of-the-art of microprocessors and microcomputers written by one of the leading experts.

Rony, P.H.— THE 8080A BUGBOOK: Microcomputer Interfacing & Programming £8.35
The principles, concepts and applications of an 8-bit microcomputer based on the 8080 microprocessor CPU chip. The emphasis is on a computer as a controller.

Scelbi— 6800 SOFTWARE GOURMET GUIDE AND COOKBOOK £9.20

Scelbi— 8080 SOFTWARE GOURMET GUIDE AND COOKBOOK £9.20

Haviland— HOW TO DESIGN, BUILD AND PROGRAM YOUR OWN WORKING COMPUTER SYSTEM. £7.10

Spencer— GAME PLAYING WITH BASIC £5.95

Schoman, K.— THE BASIC WORKBOOK £4.10

Sirion, D.— BASIC FROM THE GROUND UP £6.20

Soucek, B.— MICROPROCESSORS AND MICROCOMPUTERS £19.40
Here is a description of the applications programming and interfacing techniques common to all microprocessors.

Spracklen, D.— SARGON £10.00
A computer chess program in Z-80 assembly language.

Titus— MICROCOMPUTER ANALOGUE CONVERTER £7.60

Titus— 8080/8085 SOFTWARE DESIGN £7.60

Tracton— 57 PRACTICAL PROGRAMS & GAMES IN BASIC £6.65
Programs for everything from Space war games to Blackjack.

Waite, M.— MICROCOMPUTER PRIMER £8.95

Waite, M.— YOUR OWN COMPUTER £2.25
Introduces the beginner to the basic principles of the microcomputer.

Libes, S.— SMALL COMPUTER SYSTEMS HANDBOOK £6.20
The Primer written for those new to the field of personal home computers.

Lippiatt— ARCHITECTURE OF SMALL COMPUTER SYSTEMS £6.10

Moody, R.— FIRST BOOK OF MICROCOMPUTERS (the home computer owner's best friend) £4.00

McGlynn, D.R.— MICROPROCESSORS — Technology, Architecture & Applications £11.30
This introduction to the computer-on-a-chip provides a clear explanation of the important new device.

Hordeski— MICROPROCESSOR COOKBOOK £4.95

Monro— INTERACTIVE COMPUTING WITH BASIC £4.35

Nagin, P.— BASIC WITH STYLE £4.50
Programming Proverbs. Principles of good programming with numerous examples to improve programming style and producing.

Ogdin— SOFTWARE DESIGN FOR MICROCOMPUTERS £8.85

Ogdin— MICROCOMPUTER DESIGN £7.45

Peatman— MICROCOMPUTER BASED DESIGN £6.10

Peckham— HANDS ON BASIC WITH PET £10.50

Peckham— BASIC — A HANDS ON METHOD £8.65

Sawusch— 1,001 THINGS TO DO WITH YOUR PERSONAL COMPUTER £6.00

Coan, J.S.— BASIC BASIC £7.00
An introduction to computer programming in BASIC language.

Ditlea— A SIMPLE GUIDE TO HOME COMPUTERS £4.10

Freiberger, S.— CONSUMERS GUIDE TO PERSONAL COMPUTING AND MICROCOMPUTERS £6.00

Gilmore, C.M.— BEGINNERS GUIDE TO MICRO PROCESSORS £4.90

Safford— COMPLETE MICROCOMPUTER SYSTEMS HANDBOOK £8.75

Gosling, R.E.— BEGINNING BASIC £3.45
Introduces BASIC to first time users.

Graham, N.— MICROPROCESSOR PROGRAMMING FOR COMPUTER HOBBYISTS £7.15

Hordeski— ILLUSTRATED DICTIONARY OF MICROCOMPUTER TECHNOLOGY £6.95

Heiserman, D.L.— MINIPROCESSORS FROM CALCULATORS TO COMPUTERS £5.35

Ward— MICROPROCESSOR/MICROPROGRAMMING HANDBOOK £6.00
Authorative practical guide to microprocessor construction programming and applications.

Goodman— TROUBLESHOOTING MICROPROCESSORS AND DIGITAL LOGIC £5.90

Zaks, R.— INTRODUCTION TO PERSONAL AND BUSINESS COMPUTING £8.60

Zaks, R.— MICROPROCESSORS FROM CHIPS TO SYSTEMS £8.50

Dear Sir,

I have a Video Genie and encountered the same problem with Mr Archer's "Mousetrap" as Mr Huntington. My adaption is much simpler as it only involves changing one line.

If 110 G=PEEK(14400)
becomes 110 G=PEEK(14352) then keys 3 to 7 will operate the game.

Key 7 takes the place of the space bar and keys 3 to 6 replace the arrow keys of the TRS-80.

Yours faithfully,
David Jones.

8 Charlton Road,
Edmonton,
London N9 8EG.

(* Many thanks to all those who suggested various mods and to Lowe Electronics who contacted Mr Huntington direct with the answer he needed. Ed. *)

Dear Sir,

I would like to inform the readers of 'Computing Today' of the formation of a SHARP PC-1211 USERS CLUB. The club has been formed to share news and programs on the PC-1211 and TRS-80 pocket computers.

Membership is charged at £5 per year for twelve issues of 'OUTPUT', the club newsletter, and in return members are entitled to discounts on software etc.

The club would also like to give its full support to the inclusion of PC-1211 programs in 'Computing Today' as this is a very practical and useful machine.

Yours faithfully,
Jonathon Pakeyne.

281 Lidgett Lane,
Leeds LS17 6PD,
Yorkshire.

Dear Sir,

"Nascom Re-number" in January's Computing Today contains two bugs:

1. The line numbered 01E0 should read ZICOPY EQU 49. To correct the program, change the contents of 0DB6 to 49 (Hex). Without this correction the program calls the wrong monitor copy routine with spectacular results.

2. A more insidious fault: The BASIC routine PHTOA used by the program has an anti-social habit of printing 'carriage return' every 48th character (the width of the screen). The fault may or may not occur, depending on what *width* it is set to, and the length/complexity of the program. To cure :

Change the contents of 0D4A,B,C to CD 38 0E

Insert a patch at 0E38:

```
0E38 21 00 00   PATCH LD HL,0
0E3B 22 AB 10   LD (10AB),HL
0E3E 2A E6 0D   LD HL,(LINNUM)
0E41 C9         RET
```

This patch clears BASICs count of the numbers printed to zero before PHTOA is called.

Note also that (for people with assemblers) line 0DF0 should read LD (HL),A. If you have just typed the machine code in Hex, it doesn't matter. Once fixed, a fine program.

Graham Smith.

22 Naples Road,
Edgeley, Stockport,
Cheshire SK3 0TN.

Dear Sir,

While I appreciate that BASIC and machine code are the most commonly used hobby languages, please spare a thought for the rest of us who do not have a computer of our own and use school or business computers. My school has an Apple II plus which is set up for Pascal, and the teachers are *very* anti-BASIC! So what about thinking of other languages? e.g. Pascal, simple, (yes simple!!), RPN etc.

Also, what has happened to the SOFTSPOTs?? I thought they were the best thing since the two-piece swimsuit!! Thumbing through my latest few CTs I have found nothing!

Thanks muchly,
Glenn McAllister.

281 Karori Rd.,
Karori,
Wellington 5,
New Zealand.

(* Softspots are still with us, we are just presenting them in a slightly different format. Ed. *)

Dear Sir,

Whilst flattered that my previous letter to you has started a correspondence, I feel driven to reply to Mr Watson's comments in your January issue.

He has missed my point completely; I am not asking for a program as such, just a printed collection of routines which the user can then incorporate into his own machine code programs. Thus the program overhead is nil as none is required. The whole point of the idea is that it is not a compiler nor is it an assembler.

I hope that this clears up any doubts which prospective implementers may have.

Yours faithfully,
Jeremy Waine Ruston

4 Hornton Place,
London W8 4LX.

Dear Sir,

We liked the 'Stockmarket' program in your December issue, especially after we had removed some bugs!

The two mains snags were in stock dealing, starting at line 270;

a. NN is set up at line 1340 for each commodity in turn, and is finally left at the value for Lead. At line 1570, NN is used to check that the number of shares to be bought is within permitted limits, and that means a different value of NN for each commodity. We solved this by making NN an array, with subscript X at 1340-1360, and subscript C at 1570.

b. In line 1790, it appears that S(X) should be S(M).

We were also a little suspicious of the multiplication by unity in line 740. Should this be .1? It hasn't proved vital so far, as prices never seem to rise high enough to invoke the dividend option, so at line 530 CD(X) never reaches five. Perhaps line 230 needs a change; as it stands, it seems a trifle odd. . .

A point arising from the printouts is that it would be helpful if the intended display style for a program could be mentioned — in this case the reference to scrolling implies a screen display, but some combinations would need a very big screen! (Should TF in line 490 and line 2690 be the same as the TF used elsewhere? It is the main reason for excessive output text length.)

'Cells and Serpents' is also running on our Sorcerer, but as one of us is an established 'Dungeons and Dragons'® expert it has to compete with a full Adventure-type version that is steadily growing to full maturity — in machine code without the aid of an Assembler! Sheer masochism.

Finally, may we suggest that the number of Sorcerers in use is no longer negligible and, despite numerous criticisms, the Sorcerer BASIC is commendably standard so conversion from Sorcerer BASIC programs is relatively easy. It is sad that Exidy fail to document all the available facilities, which we have to discover for ourselves, but that's part of the fun! Something relevant to this particular machine now and then would be encouraging.

On behalf of Sorcerer users in the Harrow area;

Yours faithfully,
Don Thomasson.

16 High Worple,
Rayners Lane,

(* Any offerings for our pages? Ed. *)

Dear Sir,

May I congratulate Computing Today December issue for the very high quality of the programs and the documentation for both 'Cells and Serpents' and 'Stockmarket'! I experienced very little difficulty at all in transcribing both of these listings to run on Apple II. The notes accompanying both these games were most explicit.

There does, however, appear to be a fundamental flaw in the 'Stockmarket' listing which prevents proper share dealing and prints up "fraud" on the display. I have traced this to line 1570. Firstly, I suspect the line should have read:

```
1570 IF A$ = "B" AND N>NN THEN 1640
```

Even so, the variable NN has not been redefined. According to the listing published, NN was last used during the share dealing display in lines 1270 to 1380. NN, therefore, will always refer to the number of lead shares available where X=4 in line 1340. If you have bought all 1000 lead shares, you will have problems trying to buy anything else!. I suggest the following line alterations :

```
1340 NN(X) = INT(BB/P(X))
1350 IF NN(X) > M(X)-S(X) THEN NN(X)=
     M(X)-S(X)
1360 PRINT TAB(18);NN(X);
1570 IF A$= "B" AND N >NN(C) THEN
     1640
```

Incidentally, for anyone who has Apple Pascal, but does not have a word processing package, have you considered the possibilities of the Pascal Editor? If you type out your letters etc. using the normal editor facilities, the following will give you hard copy :

```
F(ILER)
T(RANSFER)
TRANSFER WHAT? APPLE1:SYSTEM.WRK.
TEXT
TO WHERE? PRINTER:
```

Many thanks for a most enjoyable magazine.

Yours faithfully,
Alan Robinson.

Alive... well... and very healthy

As a Nascom user I had enormous satisfaction and sensed an excitement about the future when told that I had Nascom.

I have been determined from the start of the troubles that Nascom would be revived and with several colleagues formed an association with sufficient finance to purchase and expand the new company.

Being a customer I am only too well aware of the frustrations caused by Nascom's supply problems. The root of these was cash and, as we will not have that problem, I am very confident that Nascom International can progress quickly and professionally into a normal supply situation.

While immediately supporting our traditional marketplace we intend to expand the company rapidly into the manufacturing of industrial Nascom products. The design of certain products is already under way and the first of these will be a Prestel users receiver which will be available at the start of 1981. This is a separate, stand alone unit having no connection with previous Nascom products. We have several other projects under design or investigation that will give the new industrial division a good start next year.

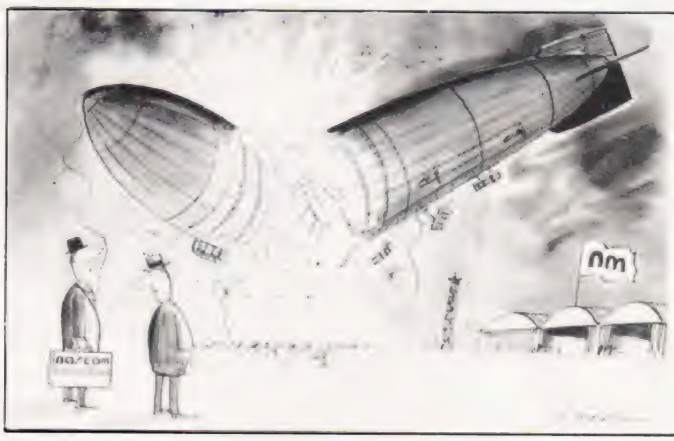
We have the finance and facilities to exploit new ideas and would be very pleased to hear from any designer who has an idea based around Nascom products. Anyone with hardware or software please write to me at Pall Mall.

Nascom announced many products in the last year few of which arrived. Luckily during receivership many of these designs were completed and we will immediately be purchasing supplies to make these available a.s.a.p.

There are also other Nascom 2 products defined that we will quickly engineer and produce in the next few months.

The future for micros is undeniable and Nascom International intends to retain its rightful place at the head of European microcomputing.

Peter Mathews Chairman



Competition-best caption 3.

To allow the frustrated to vent their ire and the imaginative to vent their flair we invite your captions to the four cartoons that appear this month. A prize for each and the winners published. You can't win if you are too rude as we can't publish. Send to Chesham marked "Cartoon".

New Start With 20,000 users and a good deal of frustration and uncertainty mixed into the enthusiasm we invite everyone to write with their ideas and needs. The new home division will not be able to answer all the letters but policy decisions on direction can best be made on research into user needs.

Dealers We intend to continue the policy of sales through dealers and Nascom International will not be selling products direct to the public. Stocks we know are depleted and we would ask you to allow us time to restock our dealer network.

CC ELECTRONICS

THE SKY'S THE LIMIT FOR YOUR SHARP MZ80K with SHARP CP/M 2.21 (XTAL)

CP/M is the trade mark of Digital Research

This sophisticated interactive program development system will give your home computer BUSINESS/INDUSTRIAL potential.

Basic CP/M facilities include:

- Dynamic file management
- Fast assembler
- General purpose editor
- Advanced debugging utility

YOUR SHARP CP/M 2.21 (XTAL) PACKAGE INCLUDES

- Hardware modification (if fitted by a SHARP dealer does NOT break the guarantee)
- SHARP CP/M 2.21 (latest version) on disc
- XTAL Monitor and Operating system
- 7 Digital Research manuals
- CP/M Handbook (by RODNAY ZAKS)
- 12 months guarantee and up-dates

IF YOU ARE A SHARP MZ80K OWNER, CP/M 2.21 (XTAL) IS A MUST FROM £200.00

Ask your SHARP dealer for further details or contact CRYSTAL ELECTRONICS

CP/M SOFTWARE HOUSES—XTAL CAN HELP YOU ESTABLISH YOUR SOFTWARE ON THE SHARP

NEW ZX-80 BOOK FOR 1K

This unique book, "30 Programs For The Sinclair ZX-80 1K", offers 112 pages packed full of information. With this book, you will realise the hidden power of the ZX-80.
Programs include LUNAR LANDER (with descending spaceship display), DR. ZX-80 (a conversational program), BLACKJACK (amazingly this 1K program holds an entire 52 card pack, shuffles it, deals and keeps score!), LINE RENUMBERING, MEMORY LEFT (a USR function tells you to the byte how much you have left), SIMPLE SIMON (using letters 7 lines high!), HANGMAN, MASTERMIND, GOMOKU (a challenging Japanese board game), and 21 other programs.

"THIS BOOK IS EXCELLENT!"
— CLIVE SINCLAIR

As well as offering you program value of well over £20, the programs illustrate techniques you can use in your own programs, such as space compressions, PEEKs and POKEs, use of display as memory, and USR functions.

Available by mail order only. Send £6.95 plus 50p post and pack (orders outside the UK please send £7.95). Orders to: Melbourne House Publishers, 131 Trafalgar Rd., Greenwich, SE10. (Correspondance to Glebe Cottage, Glebe House, Station Rd., Cheddington, Leighton Buzzard, BEDS LU7).

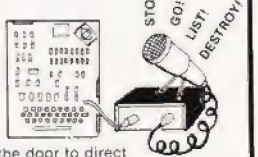
BIG EARS

SPEECH INPUT FOR YOUR COMPUTER!



BIG EARS opens the door to direct man-machine communication. The system comprises analogue frequency separation filters, preamps and signal conversion, together with a quality microphone and extensive software.

Words, in any language, are stored as "voice-prints" by simply repeating them a few times in "learn" mode. Using keyword selection techniques, large vocabularies can be constructed.

Use **BIG EARS** as a front end for any application: data enquiry, robot control, starwars — the possibilities are unlimited...

BUILT, TESTED & GUARANTEED ONLY £45!

PRICE INCLUDES POSTAGE & PACKING. PLEASE ADD VAT AT 15%.

WE ARE NOW STOCKING THE APPLE II AT REDUCED PRICES

EXTENDED WARRANTY BY COMPUCARE

16K **£599**
32K **£649**
48K **£659**
} + VAT

Getting Started APPLE II is faster, smaller, and more powerful than its predecessors. And it's more fun to use too because of built-in features like:
● BASIC — The Language that Makes Programming Fun. ● High-Resolution Graphics (in a 54,000-Point Array) for Finely-Detailed Displays. ● Sound Capability that Brings Programs to Life. ● Hand Controls for Games and Other Human-Input Applications. ● Internal Memory Capacity of 48K Bytes of RAM, 12K Bytes of ROM; for Big-System Performance in a Small Package. ● Eight Accessory Expansion Slots to let the System Grow With Your Needs.
You don't need to be an expert to enjoy APPLE II. It is a complete, ready-to-run computer. Just connect it to a video display and start using programs (or writing your own) the first day. You'll find that its tutorial manuals help you make it your own personal problem solver.
